Any poultry raiser can easily and quickly clean out Lice and Mites by using a new remedy recently discovered by a Kansas City Chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 567, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhea Remedy, the standard, time-tested remedy. Pay the postman only \$1.00 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.—Advertisement.

Diseases of Poultry

By D. E. Salmon, D. V. M. Every poultryman needs this book. It contains 250 pages, treating in a thorough manner every disease fowls are subject to. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. The cure of all diseases is plainly and thoroughly given. 72 illustrations. Price, \$1.00, postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago

tion known as the Barnum Poultry Association. The refreshing thing about my recent visit is the fact that the improved Standard quality of the Barnum Leghorn was nothing short of astonishing. They have been securing good male birds from the outside, from breeders of Standard Leghorn stock.

I am positive that we can adhere strictly to Standard requirements in any breed recognized by the American Standard of Perfection and by breeding along these lines according to quality, also develop an egg yield high enough to satisfy the ordinary human mortal, and at the same time retain general vigor and vitality in the flock.

I have written much more than I intended, but you can readily see that I am more or less concerned over the present situation of affairs in connection with the A. P. A. As a member of the American Poultry Association of a number of years standing, a licensed judge, and employed in a position which demands my every effort in helping advance Standardbred poultry which means better poultry, it is only natural that I am vitally concerned over the present condition of the American Poultry Association and what the possible outcome may be. There is one point that the general public should not overlook; we fellows who have spent the first twenty years of our active life in the poultry business, and look forward to spending the remaining twenty years in poultry; we fellows who have studied, and labored and come up, and whose future now rests on this business, are surely entitled to full confidence. We are not desirous of retarding progress. I stand for progress. I want to see more Standards printed, sold and put in the hands of poultry raisers.

Breeders and fanciers, the A. P. A. hangs in the balance. Is it to progress? I will refer to the famous breed book proposition, the Plymouth Rock and Wyandotte breed books respectively. A lot of money has been squandered on these Mother Hubbard encyclopedias that cover about everything. Few are buying these breed books. Personally, I have seen but one Plymouth Rock book in the hands of a Plymouth Rock breeder, and I cannot recall to mind of ever seeing a single copy of the Wyandotte book in circulation. There is no one thing that would advance Standardbred poultry more rapidly than a breed standard, but let it be a breed standard and nothing else, cutting out all ancient history, as well as long drawn out articles revealing various poultry secrets and

advice, from curing pip, on up to how to build a complete hennery. Who is there that doesn't realize that a pinch of oyster shell and grit is magic buncombe for helping the disposition of the specimen that is being crated and shipped to show? Why in the world is it necessary to include such a line of poultry information in a breed standard? The average poultry keeper gets this kind of information as regularly as his daily meals. What he needs in a breed standard is a book that illustrates and tells just exactly what is required in the way of size, form and color for the breed that he may be particularly interested in. No addition to this is necessary.

The publication and the distribution of actual breed standards that sell for 25c a copy would result in an increased knowledge on the part of the great run of poultry keepers toward their chosen breeds that we can little realize, and who is there that can measure what such a knowledge on the part of beginners, farmers, back-lotters and new breeders would mean toward advancing Standardbred poultry? Think this over and try to figure it out. Any judge knows and will tell you that ignorance (if we may be permitted to use that word) on the part of the average poultry breeder who exhibits in the small shows, on the general knowledge of Standard requirements of his breed, is often appalling. How about those who have never even reached the point of exhibiting. Put out a breed standard that will be sold and used—then watch the advance made in breeding Standardbred poultry.

Doesn't it stand to reason that the influence of instructive knowledge spread broadcast is bound to have material and decided effect along the right line? On the other hand what progress can we hope for so long as we can meet and come in contact with poultry breeders galore that know not what a Standard of Perfection looks like?

What we have said relative to the breed books, which in recent years have been published, and which an attempt has been made to sell at \$2.50 a copy, applies in lesser degree to the present Standard of Perfection, which we all admit is a wonderfully good book for its purpose but has never enjoyed the wide distribution it should have received. When the American Poultry Association puts out a small individual breed standard, true and sure progress is bound to take place. As the American Poultry Association stands today it is of little benefit to the poultry breeders at large.

Rearing as Important as Breeding

So much attention has been concentrated on selective and scientific breeding and the importance of systematic mating has been so emphasized (one is almost inclined to write exaggerated) that other important points hardly receive the notice they merit and in some cases they are in danger of being overlooked altogether. One can fully realize how essential it is to breed for eggs, but unless the birds have been reared well and the feeding and general management are on correct lines the best bred birds will yield but disappointing results.

In the first place it is not sufficient to mate high class birds together to get the best results. The conditions under which breeding stock are kept have a great bearing on the results. Get as near nature or natural conditions as you can with your breeding stock. To breed well birds should be both healthy and happy and unless the conditions under which they are kept ensure the maximum of health and vigor the succeeding generation will suffer in some way. Environment tells to some extent and although birds kept in close confinement under cover, may breed well the progeny can hardly be expected to equal those from similar stock running on a free range. Fertile eggs are not the only consideration of the wise breeder. Chicks should be hatched with an abundance of vigor and vitality which will enable their inherent productive qualities to be developed to the highest degree.

Whether troubles and accidents during the period of incubation can seriously affect the constitution and the

Some of the great foundation Single Comb White Leghorn Males on Oak Dale Farm, LeRoy, Minn.

productiveness of the stock raised is a question upon which opinions may differ. It seems only natural to expect any mishap during incubation which results in the death of a number of the weaker germs to have an injurious effect on those which survive. Faults in incubation which lead to a larger percentage than usual of dead in the shell must be regarded as detrimental to the future well being of the chicks under hatch. We have heard this "dead in the shell" business described as a kind of blessing in disguise because it kills off the weaklings. We prefer to kill the weaklings off ourselves in a way which does not endanger the health of the rest of the hatch. When the "dead in the shell" trouble has been reduced to a negligible quantity and we are able to hatch almost every fertile egg we can consider our artificial methods are nearing perfection and under such conditions we can rest assured our chickens are starting life with vitality unimpaired.

It is not putting the case too strongly to state that all the efforts spent on breeding stock and all the care in selecting suitable birds for mating can be made unfruitful by faulty rearing. In the larger domestic animals the first year, and especially the first winter, is the critical time. The animal is either made or marred during that period. The growing period of a chicken's life is of equal importance. The chicken that gets stunted or even temporarily checked can never be just the same as one which goes right ahead without a check. It matters not what your system of rearing is so long as you can keep disease at bay and maintain a satisfying rate of progress throughout. Some breeders may have a liking for the survivors of an epidemic but we would sooner back the best of a batch which had suffered no casualties. When losses are numerous it can be taken for granted something is being done, or left undone which is having an injurious effect on the whole batch. It cannot be too strongly emphasized that however well a bird may seem to recover from an attack of any kind of illness it can never make up for the lost time.

There is no denying the fact that rearing may have some effect on the size of the stock. Birds which have received a severe setback during the growing period will never attain to the size and weight they might have done had they been properly attended to. Just as breeders of bantams keep birds from growing as they otherwise would by feeding on selected foods so other poultry keepers may influence the size of their stock by careless feeding.

The size of frame has some influence on the size of the egg. A small bird may lay a fairly large egg and a large exhibition bird may lay a very small one but these are in the nature of exceptions. By rearing badly one can produce a bird which lays an egg of inferior size even when the dams and granddams have been large egg hens. It is a well known fact that very late hatched birds often prove layers of small eggs. Their development is arrested by the approach of winter before they have finished growing and they rarely attain the size and weight of their sisters hatched in the early part of the season. In their case it is the weather which arrests development but there is no reason why other factors, such as incorrect feeding, may not have like results.

If these points are weighed over carefully it will be seen that it is quite possible for a bird of excellent breeding but reared badly to be excelled by an inferior bird which has been reared so as to attain to its maximum capacity or production. The moral is to hatch and rear so that the full capacity of every bird is reached and by so doing reap the full reward of skillful mating and selection.

John W. Moore.

Prospects for Farming.

A wholly false impression regarding the situation is being developed in that what is undoubtedly true of a certain class of farmers is made to appear as true to all engaged in farming. As a matter of fact, conditions as they affect the farmer generally are good when compared with almost any other industry in the country today. The one-crop farmer working on high-price land, raising grain, or cotton, for instance, has suffered a serious setback. But the average small general farmer with eight to a dozen cows, a few hogs and sheep, a flock of poultry and with fair-price land producing diversified crops, is in a pretty comfortable position.

The high cost of labor, which is the determining factor in so many industries, cuts a very small figure where the general farmer is concerned. Government statistics show that of the more than 6,000,000 farms in this country, only about 7 per cent. employ hired labor in any form. That means that more than 90 per cent. of the farmers actually are profiting through the high cost of labor, because the labor they are buying is their own, and the diversified products of their farms, despite reduced prices, are giving them a good labor income.

On the average dairy farm there are from eight to twelve cows, and practically all the work on that farm is done by the owner and members of his family. A good deal of the feed for the stock is produced on the farm, and in addition to the dairy products, there are certain farm products, eggs, poultry, etc., that can be sold in the local markets quite as readily as can milk and cream and butter. Many eastern farmers raise a few acres of sweet corn, often on land worth from \$35 to \$50 an acre, and the records show that they receive from the cannery for their sweet corn at the rate of as much for one acre from their \$35 land as the one-crop dent corn-farmer in Iowa, for instance, receives from two acres of his \$300 land. The man who raises sweet corn is at no time in fear of disaster, because even

if his sweet corn crop fails, which it is not likely to do, he will still have his dairy giving him two crops a day with a ready market.

An example of what is being done on many small general farms at the present time has just been made known by O. W. Mapes, who owns and operates a small farm in Orange County, N. Y. About the only help Mr. Mapes has on his farm is his 18-year-old grandson, and at the present time, Mr. Mapes says the grandson is doing practically all of the work. They keep 10 cows and 1,500 hens. The income from that farm in the month of December was approximately \$1,000, of which about one-half was labor income. Mr. Mapes says that while December was admittedly a big month with him, he has had a good balance on the right side of the ledger every month last year. E. A. Strout.

A complete poultry library that covers every phase of the industry. \$7.50 complete poultry library for only \$5.00. A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and by taking them all at a cut price, you will be well equipped to make a success of this business.

Save One-third by Ordering Six or More of these Books Now

How to Raise Chicks, by Dr. Prince T. Wood. A down-to-date manual on breeding poultry, getting hatchable eggs, incubation and brooding, both natural and artificial, preparing chick foods, feeding chicks, how to raise chicks and how to avoid and prevent diseases and losses. Tells how to make your own brooders and chick foods. 128 pages, 35 illustrations. Price 75c postpaid.

999 Questions and Answers, by Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information and right to the point. 124 pages. 75c postpaid.

Poultry Account Book. This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. A guide to making your business more profitable. Printed on paper suitable for ink. Price 25c.

Open Air Poultry Houses for All Climates, by Dr. Prince T. Wood. Tells plainly just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by successful breeders. 75c postpaid.

Origin and History of All Breeds of Poultry. Tells you where the breeds originated, what varieties were crossed to produce certain qualifications in a new breed; how they were recrossed until perfect. Postpaid, per copy, \$1.00.

A Revolution in Egg Production, by George C. Newell. Read this book and learn how you can lengthen the hen's working day in winter by the use of lights in the hen house when egg yield is lowest. It shows how you can increase the Winter egg yield 100 per cent. Cloth bound, \$1.00 postpaid

\$4223.00 In One Year on a Town Lot, by H. Cecil Sheppard. Shows how with a very limited knowledge of the poultry business and small capital, he built up a profitable business. Cloth bound, price, \$1.00 postpaid.

How to Build Poultry Houses. Shows how to build a poultry house that will give you the most profitable results. Cloth bound, price, \$1.00 postpaid.

Why Poultry Pays and How to Make It Pay. A book for the beginners in poultry raising and those who are interested in securing from the business the greatest profit obtainable. In this book you will find a complete discussion of the fundamentals that underlie success; the foundation stock; science in breeding; early hatching; chick trouble; importance of open air housing for growing chickens; early laying; artificial illumination to increase winter egg production. Paper bound and printed on special paper. 75c a copy, postpaid.

Diseases of Poultry. Every poultryman needs this book. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. \$1.00 postpaid.

How to Build Poultry Houses—A new book entirely different from our old book of similar name.—This new book presents the latest approved house designs of those state colleges and agricultural stations that have done noteworthy work along the big educational line of poultry house construction. This book contains the designs of those leading agricultural stations which have had the opportunity to study the problem in a big way for all poultry keepers. No one who is going to invest in lumber or labor should fail to secure this book. Handsomely bound in paper. Price 75c postpaid.

Why Poultry Pays and How to Make It Pay.—A book for the beginners in poultry raising and those who are interested in securing from the business the greatest profit obtainable. In this book you will find a complete discussion of the fundamentals that underlie success; the foundation stock; science in breeding; early hatching; chick trouble; importance of open air housing for growing chickens; early laying; artificial illumination to increase winter egg production. Paper bound and printed on special paper. 75c a copy, postpaid.

Cut Price for 10 Books \$5.00—Average 50 cts Each

This is a saving to you of one-third the regular price. If you have one or more of the above books, you can get the balance at one-third of the regular price by ordering six or more at one time. No order for less than six accepted at reduced price. Take advantage of this liberal offer today. If not satisfied with your bargain, return the books and we will return your money.

AMERICAN POULTRY JOURNAL, 523 Plymouth Ct., Chicago, Ill.

Let The Hens Lay More Remove The Lice and They Will

IT IS the healthy hen that lays a good egg and lays it regularly. Hens full of vitality and vigor can keep up a heavy egg production. Hens free from lice and mites—they put money in your pocket. A hen worried to death with lice cannot lay if she wants to. Feeding high priced feed to lousy chickens is a dead loss. Don't do it. Use the new way to kill lice and use LICECIL. No dusting, no dipping, no painting. Hang up the original open bottle. It acts like magic. It will help to put a few drops in nests and on roosts. Then uncork the bottle, hang it up in coop or hen house and the powerful evaporating vapors which leave the bottle will do the rest.

Licecil

Kills Lice

Protect your fowls from the powerful and insidious lice and mites that suck the life blood of your birds. These parasites allowed to run rampant in a hen house will suck more blood, more vitality every night than fowls can replace by the assimilation of large quantities of food during the day. This is a money-making and a money-saving proposition. Think it over. Extra care must be taken that not only the birds are kept clean, but every crack and crevice should be purified as well. Use LICECIL as indicated and in a few days your entire flock and hen house will be rid of every louse and mite.

How to use LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in mist form penetrate feathers, cracks, crevices everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., have no lungs. They breathe through the pores of the body and are destroyed by LICECIL vapors. Will not injure chicks. *Testimonials from every State in the Union tell of wonderful results from its use.*

Give it a Fair Trial

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give LICECIL a fair, honest trial at the earliest opportunity.

1 Bottle, \$1.00 — 3 Bottles \$2.50
12 Bottles \$9.00 — All Postpaid

Evidence!

American Supply Co.,
Quincy, Ill.,

Dear Sirs:

Enclosed please find \$2.50 for 3 bottles of the Licecil. With great success I have used it and am more than pleased with it.

I have no more trouble with lice. It is the first thing I have got that I could and would gladly recommend it to any person.

MRS. F. L. KARNES,
Riverside Dr.

Madrid, Nebr., Mar. 15, 1922.
American Supply Co.,
Quincy, Ill.

Dear Sirs:

Find enclosed check for four dollars (\$4.00) for which send me one gallon of Licecil.

I used 3 bottles of Licecil last summer, and think it is the best louse and mite killer I ever used.

Yours truly,
EMIL BENSON.

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

**Supreme at Madison Square Garden
Is Supreme Everywhere**

IMPERIAL "RINGLET" EGGS

During the past ten years the matings on my farm have done more to improve the Barred Rocks of America than all the other matings of the whole country combined.

May and June are the Banner Months to Hatch Silver Cup and 1st Prize Winners

Hundreds of my first prize winners and those of my customers have been hatched in May and June. At the 1921 Garden Show my 1st, 2nd, 3rd, 4th and 5th prize Cockerels, and 1st and 2nd prize Hens were hatched in May and June, and 1st and 2nd prize Cocks and 1st and 2nd Pullets in July.

I Ship Eggs from Finest Matings on My Farm

My Eggs Are the Best Money Can Buy — They Produce First Prize Birds

Mr. E. B. Thompson, Amenia, N. Y.

Dear Sir: Got to have another setting of eggs to insure my reputation for another year. In the Walla Walla Show held in January I won 1st on Barred Rock cockerel, also grand Sweepstakes Champion, on the same bird, for best bird in the show of all breeds; 1st, 2nd and 3rd on pullets. These birds were hatched from the setting of eggs received from you last April. The IMPERIAL "RINGLETS" sure take the lead wherever shown. We showed against birds that had taken every thing here for years.

Yours very truly,

Walla Walla, Wash., March 1, 1922.

Chas. C. Wright.

When Chicks are 4 Weeks Old
FEED THEM

FUL-O-PEP Coarse Chick FEED

The FUL-O-PEP Way is not complete without FUL-O-PEP Coarse Chick Feed. This feed should be fed as the grain part of the ration of chicks from four weeks to three months of age.

We proved by tests and experiments that we could make the already popular "FUL-O-PEP WAY" of raising chicks a still greater success for our many patrons by adding FUL-O-PEP Coarse Chick Feed.

A High Quality Grain Ration for Growing Chicks

That's just exactly what FUL-O-PEP Coarse Chick Feed is—it's just the right size and contains the correct proportions of each ingredient for chicks for from four weeks to three months of age—or until they are old enough to consume FUL-O-PEP Scratch Grains.

The three reasons why we urge you to add FUL-O-PEP Coarse Chick Feed to your FUL-O-PEP way of feeding are:

First: It prevents feed waste after the chick weans itself from *fine* chick feed.

Second: It contains an abundance of Oatmeal and Wheat—just the things to balance with mash feeding.

Third: It is without a doubt the highest quality growing grain feed ever offered the poultry raiser.

of World Famous Holterman “ARISTOCRAT” Barred Plymouth Rock Prize Winning Stock

My long-established Summer Bargain Sale of Producing parents of Prize Winners starts this year on June 1, and continues only until my last surplus “Aristocrat” breeding bird is gone. Each year the fame of this Holterman Bargain Sale at unbelievably low prices has continued to spread and this year will no doubt see these scores of powerful producing birds entirely disposed of in a very few weeks. Remember, that every bird represents a standard, fixed value, given to you at a tremendous discount from my normal prices.

You Actually Save 20-40% Off AND BELOW MY CATALOG PRICES

The name “Holterman” bears an international reputation as a breeder of world winning Barred Plymouth Rocks, painstakingly developed by my own methods and resulting in birds of supreme excellence, known to the world as my “Aristocrat” strain. They are unquestionably the biggest profit-producing birds ever bred. The very greatest of all my “Aristocrats” I use for producers—for the production of chicks that become equal and better than their parents. And each year I replace some of these famous parents with the very best of their own wonderful offspring. This gives other breeders the yearly privilege of getting some of these great producers of Prize Winning and Record Laying stock, while I, in turn, advance the quality of my breeding flock with young birds of my own thoroughgoing selection.

Why These Astonishing Bargains Are Grasped So Quickly!

See my guarantee above! Remember, my great offer has been snapped up each year, again and again, by the same people. Then remember my huge file of letters from breeders the country over who state, over their signatures, that my values at bargain prices are not equalled anywhere in the poultry business! For your benefit I have outlined every fact regarding this Great Summer Bargain Sale of “Aristocrat” Famous Produ-

W. D. Holterman, Fancier,
Box A-6, Fort Wayne, Ind., U. S. A.

Without any obligation to me, send me at once full details of your Great “Aristocrat” Barred Plymouth Rock SUMMER BARGAIN SALE.

NO SUBSCRIPTION AGENTS OR CANVASSERS
are employed by us and **NO PREMIUMS** are given
with subscriptions to American Poultry Journal.

A booth in charge of representatives equipped with
credentials and official receipt blanks will be main-
tained only at the poultry shows in large cities for
the convenience of our patrons. Do not pay money
to strange solicitors representing themselves as
agents for American Poultry Journal—simply ask
for credentials, and report to the proper local au-
thorities if fraud is attempted.

CHANGE OF ADDRESS

If you change your address during the term of
your subscription notify us at once, giving your
old as well as your new address and also the sub-
scription number which appears on the wrapper of
each copy mailed to you. If possible tear the ad-
dress off the wrapper and mark the change thereon.

C. S. BYERS *Orpington Specialist for 21 Years* **HAZELRIGG, IND.**

NOTE—You have followed my advertising in this Journal during the past winter. The sterling merits of my Strain have constantly been unfolded to you in this leading publication covering a period of many years. Through correct methods and the delivery of maximum values I have gained the confidence of thousands of the leading Orpington breeders throughout America. This priceless confidence will be maintained and the double values announced in this advertisement will be delivered.

C. S. BYERS.

Queensbury S. C. White Leghorns

NEW LAURELS WON BY OUR FAMOUS BIRDS

Our pullet 79-3 at the Vineland International Egg Laying Contest breaks all records for persistent winter laying. To date she has won certificates every month since last November and is still going strong. From November 1st to January 31st, she laid 75 eggs in the 92 most severe winter days of the year. The entire Queensbury pen—although handicapped by the loss of one bird by accident and being obliged to finish the year under these conditions—laid 317 eggs in February and thus winning highest honors for the month.

Queensbury birds are bred for winter eggs and they lay them. We have hundreds of vigorous, free range pullets with the same blood lines as the wonderful contest birds and we are offering them for sale at eight weeks and older at \$1.75 each and upwards, depending on the age and pedigree. If you want to make money from hens get our famous pedigreed stock and make a reservation at once if you want them shipped promptly and even if you want them later, order now and be sure.

INDEX TO GUARANTEED ADVERTISERS

We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any advertisement of the following advertisers, appearing in this issue of American Poultry Journal. All we ask is that, in ordering the fowls or goods, send mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list who mention American Poultry Journal when answering advertisements.

Healthy Flock Guaranteed

Let me show you how to cure White Diarrhea, Roup, Cholera and other diseases—how to raise big broilers, fertile roosters and get LOTS OF EGGS.
I lost 3800 chickens in three weeks, when the "OCULUM" man showed me how.

"OCULUM"

is a scientific HARMLESS Liquid Germicide. In 13 years, it has created CONFIDENCE and made poultry raising PROFITABLE—Journals, Experiment Stations and this Journal PRAISE it. Hawkins, Fishel and other fanciers love it.
A sample 10c, enough for 150 feeds. Each 50th sample order gets \$1 bottle FREE. Each 25th 50c order gets a pint, \$2. FREE. Each 13th \$1 order gets a quart, \$4. FREE. Postage paid.

THE "OCULUM" CO. BOX B, SALEM, VA.
Dealers Handle. Guaranteed. Agents wanted.

It's the Mammoth that's Making Big Money for the Biggest Hatchers

WHAT poultryman is making the biggest money in your neighborhood today? Ten to one he owns a Wishbone. All over the country Wishbone equipped hatcheries are making the greatest profits.

No wonder they are! Wishbone hatches better chicks for them—a higher percentage of livable chicks—at a lower cost per chick. Wishbone saves them time and labor and fuel and space. **WISHBONE IS THE MONEY MAKING MAMMOTH!**

This means a great deal to you. Let the Mammoth you'll operate next season be a Wishbone. Put yourself in the class with the big money-makers. Make the next your most profitable season. Start it with a Wishbone! Find out about this machine at once.

The Wishbone Catalog Tells You —

How the patented Wishbone heater saves fuel. How the Wishbone turning device, the removable bottom and the automatic cooling device save labor. How all handling of eggs is eliminated. How you never touch the eggs from the time you put them in, till the chicks are hatched. And hundreds of other interesting incubator facts and features. **WRITE FOR THE BOOKLET NOW.**

***Special Inducement for Orders Placed in June.

Owen Farms

**S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS**

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the world. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their pre-potency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

The 1922 Egg Trade

has taken every good shelled egg produced that has not been set here on the Farms. Many thousands of Owen Farms chickens are growing or hatching all over the country. The average quality will be the finest ever produced. Hundreds of these youngsters will develop into winners for egg customers of Owen Farms. Hundreds more will be hatched up to July 15th. June is the month of roses and also the month to hatch Reds and Buff pullets that will be in bloom and will win the large shows from Thanksgiving week on. My customers who are ordering for June delivery are wise and will have pullets just ripe for hot competition and not gone by.

Those of you who have not already ordered for delivery at half price will be glad you did so if you order now and take advantage of the half price rate and hatch winning pullets during June and July.

I will hatch here until July 15th, as I want pullets for January and February showing.

Half Price Egg Sale Now On

Look up my mating list. If you have not a copy of the list, it is yours for the asking.

Half price eggs from my finest matings are \$12.50; \$9.00; \$6.00 and \$3.00 for 15. Combined sittings of Group 2 and 3 are \$7.50 for 15. Group 3 eggs for \$30.00 for 100 and Group 4 eggs \$15.00 for 100, are wonderful value for a small sum.

Half Price Stock Sale

Will give you fine tested breeding birds for just half their value now. You can carry them over for 1922 breeding or showing. At no other time of year will your money go quite so far in securing choice birds at a low cost. Write me your exact wants, and, if you will, the amount you wish to invest; I will write you fully and advise you to the best of my ability. See how close we can get together through correspondence. Come and visit Owen Farms if you can. If this is not possible, come to me by mail.

No. 6

A Successful Back Yard Poultry Plant

Some years ago A. H. Emch and H. V. Tormohlen judged the Dayton, Ohio show. They found some very good Brown Leghorns, and during the week of the show, visited the back yard plant in which those winners' had been produced. The owner of that plant has written the accompanying article, and Mr. Tormohlen comments on the article and the author's plant as follows:

"I have known Mr. J. H. Larsh for some ten or twelve years, and about six years ago I had the pleasure of meeting him personally while judging at the Dayton Show, of which Mr. Larsh has been president or other active officer for a great many years. Mr. Larsh is a merchant tailor but he is one of the most intensely interested poultry fanciers I have ever met. At the time we were in Dayton Mr. Larsh invited us out to his "poultry plant." It was just as he has described in this article, on the back of a city lot. The lot was not as wide as the average town lot, as I recall. A large barn covered most of the lot, in fact the entire width. The residence faced to the north and so the only poultry runs Mr. Larsh had were on the north side of this barn, four in number at that time, some six or eight feet square. Windows on the alley side of the barn had been put in to admit plenty of sun-light and that barn was a veritable bee-hive of Leghorns, ground floor and up in the mow.

"In that mow at that time there were some 30 or 40 pullets, singing, scratching and laying, as fine a lot of healthy egg-producing Leghorns as I have ever seen anywhere. These pullets were kept up there all winter and the same practice has been followed during all these years. The lower part was divided off for various matings and for quarters for the male birds. The story that Mr. Larsh told me then, just as he has written here, was so remarkable that I could hardly believe what I saw, that the Leghorns could be kept, raised and propagated from year to year and year to year in this manner. And yet the story must be true and the standing of Mr. Larsh in his community and among his fellow Dayton fanciers bears out the high regard in which he is held.

"Mr. Larsh has a strain today, of his own, in all that the name means to a real fancier. He is not in the habit of introducing new blood to add stamina, size or vigor. He has been able to produce these qualities each year under these conditions—and has done more, i. e., improved the quality of his flock until in recent years he has been a regular, successful contender for the prizes at the Chicago Coliseum Show.

"A beginner could not do what Mr. Marsh is doing now, in keeping 50 to 100 Leghorns the year round under such conditions because it takes real experience to make a success of poultry in this manner. But a beginner can keep a few to start on in his back yard and by profiting by his own experience as well as the experiences of others, soon become just as expert as Mr. Larsh, in being able to keep poultry profitably on a back lot in this manner.

"As a passing thought, we believe the big old barn is Mr. Larsh's chief asset and as we have often thought of Mr. Larsh and his fowls in the years since we saw his place, we have come to the conclusion that the average back yard poultry plant would be better off if the entire plot of ground were roofed over, at least so the rain and moisture could not add to the excreta of the fowls in spreading disease. Clean dry quarters are essential and Mr. Larsh has these the year 'round."

* * *

Fifteen Years' Success with Leghorns on a City Lot.

By J. H. LARSH

I started raising chickens on my back lot fifteen or sixteen years ago, and each year kept raising a few more until now I hatch and raise 115 to 125 each year.

Most people think Brown Leghorns must have a lot of room to roam around, but my lot is only 33 feet wide by 140 feet long. There is a five-room cottage on north end

and a large two-story barn reaching clear across the lot in rear. This barn is now the chicken house. The space between, about 50 feet, has cement walk north and south not quite in the center. The largest side (south) is evenly divided into 3 pens and dooryard. On the north side, on other side of walk, is one pen and garden spot. The 2 center pens on large side of lot are shorter than outside pen and this space is used for 3 Philo boxes in which the baby chicks are kept until they are old enough to roost; then they are given one or two pens. I think keeping them dry is half the battle in raising little chicks.

The chicken house downstairs is divided in 4 pens for mated stock. In the spring they can use the runs on nice days but do not get much sun as runs are on north side of house. The upstairs is the laying house in winter.

The south side has open windows in center with muslin curtains to drop at night in coldest weather, then glass windows on each side of this to let in all the sunlight possible. It is lined with plaster board from 3 feet up, then the top and 3 sides with tar paper. We keep 35 to 45 pullets through the winter, getting eggs in coldest weather.

In early fall we begin killing and selling off utility hens, not keeping more than 10 or 12 hens through the molt. These are our best standard exhibition birds. Our early pullets begin laying about this time, so we are never without fresh eggs.

In fall and early winter we eat and sell all cockerels but those showing the best form and color, not keeping more than 8 or 9 as I do not have room for more than that.

In early spring I turn the runs over as soon as the ground can be worked, and again in the fall when I give runs to small chicks.

Of course raising so many chicks on such limited space means "eternal vigilance." I use coal-oil with a spray pump for chicken house mites, 3 or 4 times a year.

We hatch all our chickens in the incubator and try to get them all in two hatches as I have not got the room for too many sizes.

Last year we had four pullets that laid at 4½ months old, and quite often at 5 months, but I prefer them not to lay before 5 months or 5½ as I think they do better afterward. The strain is too great when they lay so young.

I never feed baby chicks until after 60 to 72 hours, then a drink of warm water and some fine sand or grit, then oatmeal and sour milk or water until they are 10 to 12 days old. Then begin with some good scratch feed, and feed only part oatmeal, gradually falling off entirely when about 3 weeks old. Separate them as soon as cockerels can be told as they always do better.

This may seem like a long letter, but I was prevailed on to write it, thinking it might help someone else, who has not much room, and who thought Leghorns needed to roam about to do well.

Plugging Up the Hole In the Egg Dollar

NO matter is of greater interest to the great majority of poultry keepers than the problem of how to secure for themselves a greater share of the dollar which the consumer pays for eggs. The interest in better methods of marketing eggs is great but the progress made in improving marketing methods has not been particularly noteworthy, at least so far as the actual egg producers are concerned in the heaviest egg producing states.

The achievements of the California organizations in topping the New York market with Petaluma eggs and the successes of other co-operative egg marketing associations on the east and west coasts have aroused the interest of egg producers in Illinois, Iowa, Missouri, Indiana and the other heavy producing sections, but up to the present no satisfactory plan has been evolved for handling the great bulk of the commercial egg crop in other than the regular routine channels, where the producer loses all control of the product as soon as it leaves his farm.

A great many attempts at co-operative marketing through egg circles and similar local organizations have been made in the corn belt states, but the history of such attempts is one of almost universal failure.

During the last few years great strides have been made in giving the producer a greater voice in the ultimate price of his grain and live stock through the co-operative elevators and live stock shipping associations. That similar progress has not been made in poultry and egg marketing indicates that the need for such co-operative effort is not so great as with grain and live stock, or else the problems of handling poultry products successfully are more difficult and complicated than with the other farm staples.

It is possibly true that the intense competition in the egg markets due to the fact that very little capital and practically no equipment is necessary for engaging in this branch of marketing has reduced the margin of profit to the dealers so that it is more difficult for co-operative enterprises to make a good showing in handling eggs and chickens than is the case with wheat or hogs.

In most of the smaller towns eggs are considered as equivalent to cash and it is a regular practice with many merchants to pay the farmer the top market quotation for eggs in order to secure his trade. In many cases the merchant pays the farmer as much or more than the wholesale cash quotations and donates all of the labor in candling and packing the eggs and stands the losses from breakage and spoilage, in order to secure the farmer's trade. As long as this condition exists there is small chance for co-operative concerns to improve the market unless they can improve the quality of the eggs produced, because the co-operative concern must pay for the labor required for handling which the merchant donates.

Observation of the present competitive methods of handling eggs leads to the conclusion that in most sections the farmers are getting about as much as the market will justifi-

By T. S. TOWNSLEY

Should I ship my eggs to New York or sell locally—The experiences of four different shippers in four different markets—Grade the eggs.

fy for the type of eggs sold. The great marketing need, so far as it affects the average corn belt farmer in selling his eggs, is for a marketing system that will buy eggs on a graded basis and pay according to the quality of the eggs offered. In most every community there are progressive poultry keepers, who, largely through pride in their prod-

uct, continually offer eggs that are strictly first class in quality, while a large number of careless producers take no special pains in grading their eggs because local dealers pay the same price regardless of quality. This system, of course, penalizes the careful producer and keeps down the price of all eggs due to the fact that there is no incentive for improving the quality of eggs marketed.

It is a well known fact that the discriminating consumer is perfectly willing to pay a premium for first quality eggs, and there appears to be no logical reason why Mrs. Smith, who markets only first class eggs should not receive more credit than Mrs. Jones, who slips in the infertile eggs out of the incubator and the uncertain eggs out of the stolen nest, together with all the small and dirty eggs from her flock.

Most local dealers refuse to make a discriminatory price on eggs for the very good reason that they would lose the trade of Mrs. Jones if they paid her less than they offer Mrs. Smith.

In view of the fact that local marketing agencies seldom

offer premiums for quality eggs, a considerable number of progressive poultry keepers are finding individual outlets for their first class eggs and are working out individual marketing methods that beat the local prices. These individual marketing schemes depend largely on the ingenuity of the person who has the quality product for sale, but usually fall into one of three general plans. Either eggs are shipped direct to commission merchants in the larger cities who have an outlet for quality eggs, or they are shipped direct to retail stores that cater to fancy trade, or

are sold directly to individual consumers who desire quality products. These three types of marketing are well illustrated by the experiences of E. T. Petar of Doniphan, Mo., T. W. Edwards of St. James, Mo.; and Mrs. F. A. Millard of Kingsville, Mo.

E. T. Petar has a commercial White Leghorn farm, handling around 500 hens in a section of the Ozark country where marketing conditions are particularly poor. Mr. Petar has been shipping his eggs direct to commission merchants in New York City, and finds that after paying the express, commission, and cost of cases, he still has a considerable margin of profit over the local prices. During the year ending January 1, 1922, he shipped from four to sixteen cases of eggs each month to the New York markets and received an average net price after deducting all charges of 43c per dozen for all eggs shipped. For the same period the average local price paid at various Missouri, buying points, as shown (Continued on page 683)

Success In The Business of Hatching Chicks

DURING the past five years there has been developed in this country a new industry of vast importance. Man has accepted the challenge to replace the biddies of chicken yard fame. Formerly he had accepted the hen as the only safe and sane means of converting her eggs into chicks, even as he granted her undisputed honors in furnishing the eggs. Then along came an inventive genius who gave to the world a man-made substitute which hatched the eggs as well as biddy—sometimes. People experimented, as people will. Many who made the test were glad to restore the time honored biddy after a season or two of incubator experience. Said they, "Lumber and coal-oil can't do the work as well as the hen. She was made for that job—has all the appliances and knows how to apply them—so why spend time and money on artificial incubators."

As time went on, and later models were invented, it became evident that the incubator had come to stay. At first it was added to the farm equipment to supplement the work of biddy—sort of help out in an emergency as it were. Slowly it became more of a necessity. Then at last the mammoth incubator followed the small machine as the automobile was successor to the bicycle.

Men who had observed the opportunity to do hatching, as a business, went to work on a larger scale. From the 150 egg size they increased to units of 150 linked together, forming a total capacity of 40 such units, heated from a single source. These first mammoth machines were warmed by hot water systems. This man-size equipment made of hatching chickens a real man's business, and here is where the Smith Bros. of Missouri figure in the case.

Floyd Smith, the senior partner in the firm of Smith Bros., owned and operated a retail store. As a recreation and hobby he commenced studying the hatching and raising of poultry. At his home he installed a 100 egg incubator, intending to raise broilers scientifically. He became very much interested in his experiment and decided to learn all it was possible to know about chickens. It was his ambition to know more than others in the same business, and he proceeded to do that very thing. From one incubator Mr. Smith raised his hatching capacity to four, which he installed in the basement of his store.

With the starting of those four machines was launched a gigantic enterprise. That was four years ago, nobody outside of Audrain County, Missouri, had ever heard of Smith Bros.

It was at this time that Smith Senior decided to make chicken hatching his business rather than his recreation. He commenced selling day-old chicks to people in his own community. The venture proved successful. The chicks netted him a good profit and his customers found it profitable to do away with weeks of idleness on the part of their laying hens, plus the gain in time that would have been spent had they been caring for an incubator at home.

By FRANCES J. MEARA

Two brothers close out their retail business and install a 12,000 egg incubator—Output grows to 300,000 chicks a season—New opportunities in custom hatching.

The junior partner, Allen Smith, who had been a world war veteran, came home from France in May, 1919. Like many of the boys he had gone from school into an army training camp and his discharge left him looking for a job. Smith Senior was ready with the job. With the success and consequent growth of his chicken industry he had formulated

plans for a mammoth hatchery, and he needed help. Accordingly the brothers combined forces. The first thing on the program was getting out of the retail business, which they did on short notice by holding a stupendous sale. When the building had been cleared, a 12,000 egg incubator was installed. That was in July, 1919. As a merchant, Smith Senior had learned the value of advertising and commenced his campaign with suitable ad matter. His selling area was confined to the state of Missouri. Before the end of the year the firm's hatching capacity had been increased to 25,000 eggs at one filling of the mammoth machine, and the spring following they were able to fill just half of their orders. By the first of March, 1921, the plant had assumed mammoth proportions and was equipped with incubators totalling a capacity of 40,000 eggs. Advertising had spread the fame of the hatcheries

to other states and the man at the desk was kept busy receiving orders and checking them in line for future shipment.

Getting the 40,000 eggs to supply the monster every three weeks was a problem. This obstacle was surmounted by flooding the country in the surrounding territory for a radius of forty miles, with circulars announcing that Smith Bros. Hatcheries would pay five cents a dozen more for eggs than was being paid by any other dealer. In these days of automobiles, farmers drive twenty miles and farther to deliver eggs to the hatcheries.

All eggs used at the hatcheries are candled as they are received; then they are candled again when they are placed in the machines; and likewise on the fourteenth day after

setting they are candled for fertility. The trays are filled on Monday of each week, that is one-third of the 40,000 capacity or about 13,300 eggs are set weekly. Each tray contains 150 eggs and the largest of the machines holds 15,600 eggs. As each tray is filled it is labeled so that there can be no mistaken identity in regard to the breed of chicks. The turning of the eggs which is managed with an automatic crank, is done from three to five times daily, one twist of the crank turning over 6000 eggs. The machines are heated with a hot water system and each compartment is furnished with a thermometer. If the compartment becomes too hot a ventilator opens and allows the surplus heat to escape, closing again automatically when the temperature has been properly reduced.

Custom Hatching.

Occasionally there are times when it is impossible to buy eggs enough to fill all of the trays. At such times the hatchery does custom hatch- (Continued on page 683)

The Mammoth Incubator on hatching day.

The Pekin Duck As A Profitable Market Fowl

I HAVE raised all kinds of poultry—chickens, turkeys, ducks and geese, but the Pekin Ducks were the easiest and most profitable of all. No one who has never raised this famous market bird can realize the great possibilities of the Pekin Duck. As a money maker there is nothing in the poultry line that can compete with them. They are easy to raise—develop quickly, and are ready for market at from 9 to 12 weeks of age, at which time they should weigh from 4½ to 6 pounds.

It is not my purpose to influence the readers of this paper into buying my stock, as I have none for sale, but am merely relating my experience, which covered a number of years, during which time I raised and successfully marketed many thousand fine specimens of this wonderful bird.

The healthfulness of the Pekin Duck places it ahead of fowl. Roup and lice have no terror to the duck raiser, and other poultry diseases need not be considered.

In selecting a breed, the general rule in placing the value on poultry is to figure the amount of money to be made with the least expense.

Expensive Buildings Not Essential.

With Pekin Ducks your expense for buildings and equipment is very low. It is not necessary for to build fine large houses; they do just as well in cheaply constructed, low buildings, the main feature being that they have a comfortable place in which to lie during cold and stormy weather. A litter of hay or straw should be provided and same be frequently shaken up. The brooder or house in which young ducks are kept should be made secure in such a way that rats, weasels or skunks will be unable to get in and kill the ducks. Large numbers of ducks are lost annually in this manner, simply because people do not take the precautions to prevent such accidents. It does not cost much to equip the house with wire of a size and strength that these intruders will be easy to keep out. The doors should be made to fit perfectly and always closed at night.

What is the use of raising a fine flock of ducks and then, because it is a little trouble to do the right thing, leave them at the mercy of invading rodents? Go through every house at night, see that every bird is all right and comfortable; don't trust to the wire fence surrounding the yards that this will keep out intruders, for it will not do so. We have known a rat to dig under a foot board that was sunk into the ground, and then locate under a poultry house, nightly causing destruction and loss before it was discovered to be an inmate of the poultry yard.

Trust nothing to luck, but give careful attention to every detail, unless you want to invite failure. There is neither pleasure nor profit in raising ducks by any such haphazard methods. Aim at perfection and don't be satisfied until it is reached. It is just as easy to raise good ducks as it is to raise good chickens, and, perhaps a little easier, when one knows how.

By CHARLES F. STEM

Green ducks go to the market at ten weeks of age—They should weigh five pounds—Inexpensive buildings will do—Mating, feeding, hatching.

In starting a profitable duck flock the eggs must be from strong, healthy breeding stock, fully matured; the eggs must be properly hatched and the ducklings properly fed and brooded. Duck eggs require twenty-eight days to incubate. They usually begin to pip the shells on the twenty-sixth and twenty-seventh day, and they should all be out by

the evening of the twenty-eighth day. They are unlike chickens, which come out of the shells very soon after they are pipped. Ducks sometimes require two days after they pip before they leave the shell. Duck's eggs are very successfully hatched under quiet hens, and the hens make good brooders for them, as long as they require heat, however, for raising large numbers, incubators are the proper and surest method of hatching.

The temperature in the incubator should be kept as near 103 degrees as possible, turning the eggs twice a day, and

allowing them to air and cool once a day until they feel quite cool to the touch, but still warm when applied to the cheek. Do not turn the eggs after the twenty-sixth day. When they begin to pip the shell, the temperature may be allowed to rise to 104 degrees, but no higher. The increased heat will help the ducklings in their efforts to liberate themselves. Let the ducklings remain in the incubator from twelve to twenty-four hours after hatching to dry off thoroughly and become strong on their feet, before removing them to the brooder, which should be heated to about 90 degrees previous to receiving them. It then may be gradually lowered about five degrees each week. After the fourth week the ducks will require very little heat during the day except in cold spells. Place the brooder where the ducks can get in the sun, and you will be surprised to see how they will prefer sun heat to brooder heat.

Baby ducks are "big" to start with.

Feeding.

After removing the ducklings to the brooder, offer them their first meal of fine, sharp sand and lukewarm water. This supplies them with grit and gets their digestive organs in condition to receive their first food, which is a mixture of 1 part cornmeal, 1 part middlings, 2 parts wheat bran and 1/10 part sharp sand. Mix this well with warm water until the food is well moistened, but not sloppy. Feed this ration four or five times a day for the first three weeks, after which meat scraps may be added about 1/10 part.

They should never be fed their mash on bare ground, but should be provided with troughs or broad boards, and these should be kept very clean by frequent cleaning and scrubbing.

A Pekin duck requires some grit with each meal. Sand will answer the purpose nicely for the growing duck, but as it grows older and reaches the laying age, it will require a heavier form of grit. It is well to keep plenty of clean, coarse sand, oyster shell and coal (Continued on page 696)

A Combination Brooder and Laying House

IN an article in the December number of this Journal, I briefly outlined a plan for the man who wanted to engage in the poultry business and conduct a one-man plant, handling from 500 to 1500 layers. After that article was published I received scores of letters from poultrymen from about every state in the Union, and some from Canada, commenting upon the seeming practicability of the idea, which was new to them, and asking for additional articles to be published in the Journal along the same line, describing the design of the house which I had said could be used as a brooder house and then later as a laying house, thus doing away with expensive special brooder houses or colony houses.

Upon request of the Editor for such an article, I have found a little time to give the readers a few details of my design of house, and how I manage baby chicks and bring them to maturity, and then produce the eggs.

I make no pretensions of having any literary ability. I am simply a plain poultryman who keeps on "sawing wood," as the saying is, raising Leghorns by thousands, and in the winter, gathering up their most precious jewels. I am not one of these experimental fellows who are always experimenting and never discovering any thing new. Whenever I conceive a new plan for doing any thing, I resolve it in my mind forty ways from Sunday, to see if there are any drawbacks to it, that would interfere with it fitting in with what I want to accomplish. If there are, I discard it at once. I always am quite sure I am right before I go ahead.

In my sixteen years experience on commercial egg farms in different states, I have had to use many kinds of houses. I have also had the experience of using seventy-five or eighty colony houses and special brooding houses, that cost thousands of dollars. In some of them one could raise chicks successfully. Moreover, I have seen where all this money was dead capital nine months in the year, and my judgment showed me a cheaper way to raise poultry and do it better, raise more and better chickens on less ground. So I designed this house which I call a combination brooder and laying house. I have built five of them for use, and have 2000 baby chicks in one of them that I have just recently completed in Pennsylvania. I have never seen a finer, healthier bunch of chicks than they are.

These houses are designed for the welfare of the chicks and for the welfare of the laying hens. I know their needs, and at the same time I have not forgotten the needs and conveniences of the man behind the chicks and the hens. He must be able to do his work easily and in a systematic way. Order and cleanliness are the first step in successful poultry culture.

Now as the American Poultry Journal goes to

By G. E. STILLWAGON

A house in which chicks are reared to maturity—It then becomes their laying house—Useful on an egg farm where limited capital requires economy.

some 95,000 subscribers every month, I estimate that about 45,000 of them want to go into the poultry business, and many of them want to own a nice, little, one-man plant of say 500 to 1500 layers; but by false ideas given them by some writers on the subject, and by seeing some poultry farms of ten to eighty acres, with colony houses of all sizes scattered

over the fields, as well as many other buildings, they conclude that their bank account will never permit them to own a poultry plant. Cheer up. Study my plan, and you will see "a light in the window for you."

Limited Amount of Land Required.

You will not need more than two or three acres in order to rear 2,000 chicks a year, and keep the pullets for layers. This will be enough for a nice little one-man plant. This ground is simply for range for the young stock as they grow up. When October comes they are to be kept in the laying house all the time. I can get more eggs from a flock of hens kept within the house all the time than I can from layers on range. If I had a house 100x14 feet, as I build them, on a back lot, I could get as many eggs from 500 to 800 hens as a man can on forty acres. It is not vast acres you need; only range to rear your pullets to strong, vigorous maturity.

I am not going to tell you how to do it, but tell you how I do it. You may not be one who could do it if I told you, for there are many of that kind. All those who are crazy to go into the business will not make successful poultrymen simply because it is not in them. You may love a chicken with all your heart, but that is no sign that you could conduct a paying poultry business. It takes several years of actual experience to find out all the why's and where for's, and then you will find some coming to you every year afterward.

In building this house which I have designed, I try to

get the ground where it is to be built level, so that I can get it down as near the ground as possible. I usually build it 96x14 feet, dividing into eight 12-ft. sections; and a feed room 12x14 feet on one end, so I can have all my feed handy. I want it close to the ground, just high enough so that the sills will clear the ground, for then I do not have to build any runways to get the chicks come to the ground. If the outlet for them is close to the ground they will all soon find their way out which is very necessary. If they have to run down a runway, two or three feet from the ground, it will be days before the most adventurous ones will go down. Many will not go down until they are weeks old unless they are pushed out and shoved down the runway. Again, being close to the ground you can keep the winter winds from sweeping under the house and it is warmer.

(Continued on page 685)

Front view of combination brooder and laying house, built on a poultry farm in Pennsylvania the past spring. The lay of the ground necessitated dropping one section below the other. Each section is 48 feet long. A 12x14 ft. feed room is on the far end. One section shows how the front can be closed in bad weather. 2000 chicks were brooded in this house the past season.

Some Poultry, Fruit and A Vegetable Garden

By **HARRY G. FORSTER**

A little land and a living—advantages of the small diversified farm—How the man of moderate means can start.

WE have heard quite a bit lately about the poultry specialist. We have been urged by many well-meaning and more or less well-informed men that the man who specialized solely along poultry lines had a far better chance of making a profitable showing than the man who divided his time and capital between poultry and allied pursuits. We have begun to believe that only by devoting one's sole time and capital to the keeping of chickens may one hope to be successful. It would appear that some of us have lost sight of the fact that there are many people whose means and circumstances do not permit an extensive poultry enterprise—at least, to begin with.

There are unquestionably thousands of men who have not the means of establishing large, exclusive poultry establishments. Many a man with a family feels that in addition to his poultry, some other farm live stock, plus fruit and a vegetable garden might aid materially in making his farm enterprise a success. He figures that such a farm would be less expensive to equip, but he hesitates because he has been told that his only hope of becoming a "real" poultryman lies along the lines of specialization. "This is the age of the specialist" has been dinned into his ears so long that anyone not so engaged seems destined to fail.

The Poultry Farmer.

We find that in many cases a well-defined, well thought out plan, including other things in addition to poultry, in a small agricultural enterprise, can be developed logically, economically, and with far fewer chances of failure than where poultry is the sole source of income. Permit me to say at the outset that I do not decry the poultry specialist in any way. He is a product of the times. But I have found from personal observation and from the observation of those who have made a careful study of this matter, that, after all, the specialist covers only a rather limited field of poultry keeping. The man who may benefit from a more diversified sort of farming, with poultry as the main crop, is and will remain in the vast majority. Let us go into this matter a bit farther and see how we may apply it practically to daily conditions.

Some months ago I wrote an article for the American Poultry Journal pointing out the costs incident to establishing a 1000 hen poultry plant. The letters of condemnation and commendation which reach the office of this Journal, as well as those that reached me personally, indicated the interest that the discussion of this subject had aroused in the minds of many people. Whether the correspondent agreed with me or not, I could easily read between the lines his keen interest in the matter, and his strong conviction one way or the other. The main objectors were those who said that I had discouraged many good intentioned people who could become successful poultry keepers but who did not possess the sum I stated as the amount of capital necessary to start a poultry plant, and that my article would therefore have a tendency to discourage their starting in the business at all. While I still maintain that my figures were basically correct, and while I still believe that to establish and fully equip a thousand hen plant—buy the land, dwelling, put up the brood houses and laying houses—it is necessary to have ten thousand dollars. I do not wish to give the impression that one could not become a poultryman unless these plans were adhered to. It is with these thoughts in mind that this additional article is written. Let us see how the man of more moderate means may hope to attain his goal.

Pasturage for the Cow.

The past few years have brought out the tremendously important part milk plays in all of its forms—or should play—in the poultry menu. Tests prove conclusively to us the beneficial effects of the various elements we find in whole, skim, sour, dried, and buttermilk. We have seen how they

tone up, strengthen, nourish and build up the growing chick. We have seen how hens thrive upon it, and in what manner the winter egg yield may be increased without in any way lowering the vitality of producers. In short, the modern poultry keeper does well to consider milk as of paramount im-

portance. Now how may this milk be secured most economically and unfailingly in most cases? Usually by having one or more cows on the farm. Every student of agriculture knows that the more of his farm crops he can feed on the farm, the more he can market his own grain and his own milk to himself, the more profitable his farm becomes, for he is then running his own factory, producing his own raw material, and selling his finished product after all the profits which have led up to it are his.

May not the same thing be applied to the poultry producer who is in a position to keep a cow or two? We all realize that the intensified poultry centres of our country, where every foot of the ground is used for one special purpose, are best employed in that manner. All of the various conditions make the keeping of chickens upon this scale both profitable and logical. But we also know that these centres are the exception rather than the rule, and that the average keeper of chickens might well, indeed, benefit from a more liberal use of agricultural aids to make his main crop, that of chickens, most profitable. Profit, as we realize it today, not only means dollars taken in, but dollars saved by an economical system of feeding and housing. Of course, if you are located in the midst of neighbors who can supply you with milk products at lowest prices, that is another matter. But again this is the exception rather than the rule.

Here in the East particularly where the farm units are smaller, we find that the raising of poultry is generally most profitable when operated in connection with other farm products. Possessing a climate favorable to the growing of the smaller grains, green feeds for summer and winter use, well watered fields and meadows with orchards at every hand; a genial, rather mild climate almost entirely lacking the hot, dry winds of the western plains or the intensely cold and blizzards of the northwest, the East offers excellent opportunities for the man of small means to develop a poultry farm enterprise in keeping with his means and to his best advantage. The bugbear of ignorance concerning the care of other than poultry soon vanishes. When we consider the thousands who blithely stake their all in chickens, often knowing less than nothing about them, we cannot believe that the man of ordinary intelligence and a little capital and courage need hesitate to assume the care of live stock which usually requires less skill, knowledge and far less patience than poultry.

Dangers of the One Crop Farm.

We all know or have heard of the "one crop" man, and how, if things do not come up to expectations, he experiences a disastrous season. I know personally of two brothers, owners of large apple interests, who have become convinced that it is necessary to branch out from their exclusive enterprise to insure a more uniform means of assuring their yearly income. The killing frosts of the spring of 1921, robbed them of 90% of their expected crop, running into many thousands of dollars. Their idea is to develop a large capon enterprise, so that each year, no matter whether the apples do as well as hoped for, they are assured of some ready money coming in each year. We must realize the dangers the "poultry specialist" is forced to face. The sharp decline of table eggs in the height of the winter egg yield, a late spring with poor hatching results, poor brooding conditions due to extreme wetness or cold, a lowered winter egg yield due to unusually severe weather conditions—these and many more causes may cut his (Continued on page 693)

Facts and Fancies About Standard Making

EVERY life preserver has a hole in it so he who is to be rescued may stick his head up through it and shout. The life preserver doesn't save him—it is only a means to an end—and he must save himself by using it. In this operation the hole in the center is as important as the cork filled rim.

The Standard Committee's life preservers will be thrown out to the members of the A. P. A. struggling in the sea of oratory at Knoxville. Experience has demonstrated that they are helpful when the wind blows strong, and heavy swells break over one's head, filling his mouth, nose and ears. Then it is time to come up through the hole in the life preserver while the chairman of the convention pounds his gavel and says: "Those in favor, aye; opposed, no;" and tellers count the heads and hands that show above the flood.

It is not assumed that the Standard Committee's report should complete the work of Standard making. The recommendations of the committee go to the convention and form a basis for debate. To get a matter before a meeting for consideration and discussion, somebody always has to make a motion. Therefore, the Standard Committee moves that several new varieties shall be declared obsolete, that several new varieties shall not be admitted to the Standard, that production classes shall not be injected into the poultry show system, etc., etc.

It then rests with the members in attendance to advance reasons to support, or reasons to overthrow, each proposition that would change the Standard in any direction. The committee is absolved of responsibility after it makes its report. The convention must assume responsibility for final action. Every man in attendance will have as big a vote as any other man.

Black Leghorns.

The accompanying illustration of the 1st Black Leghorn cock at the last Chicago Coliseum show, illustrates the good type and splendid furnish of feather that is today being secured in this variety.

One difficulty in breeding the variety has been the Standard requirement of black undercolor and yellow shanks. The Standard Revision Committee has decreed that all black varieties having yellow shanks shall have slate undercolor. Slate may be very light in color. There is no definition of slate in the standard.

If this recommendation of slate undercolor for Black Leghorns is adopted by the A. P. A., as it probably will be, the present barrier to increased popularity of Black Leghorns will be removed. However, judges will want to "wise up" to the fact that anything that stops short of positive white is slate. In the female the slate may be dark; in the hackle and saddle of the male, light.

It is often said that "single mating would be possible if we had perfect birds with which to work." The fact is, the birds are true enough, but the Standard by which we judge their perfection, is artificial. Insofar as possible, the Standard Committee sought to remove arbitrary barriers, and work consistently with the natural tendencies of the varieties.

Inasmuch as there appears to be an affiliation between yellow shanks and light undercolor in neck and over hips,

By **FRANK L. PLATT**

The hole in the Standard Committee's report is the hole in a life preserver—"Star Chamber Sessions" explained—What about standard illustrations of all varieties.

want them to know a little about your variety, and it is fair that you should know a little about their problems.

When the Louisiana Purchase Exposition was held at St. Louis, the Partridge Wyandottes that won were of a dark russet color. Carver and Avey of Indiana, sold one of their winning males for \$100 to a breeder in England, where the Partridge Wyandotte at that time, was having a great boom. The bird was a sorry disappointment to his purchaser, for the English were breeding a Partridge male of the color of a pullet-bred Brown Leghorn cock. That was in 1904.

The Standard for Partridge Wyandottes then in use called for "red" in the male and "reddish-brown" in the female.

To brighten the color, the 1910 Standard was revised to call for "bright red" in the neck and saddle of the male. The back and wing bows were left "dark red." This made a two-color bird, part of which was dark.

When the 1915 Standard was prepared, Chas. Wood of Massachusetts, who was breeding some very showy, bright-red Partridge Wyandotte males, secured a Standard text that called for a neck, saddle, back and wing bows that are "rich, brilliant red." This makes a one-colored bird, free from contrast, and of a "rich brilliant red."

Still the breeders feel that this text is not explicit enough, that the bright color of the male is not emphasized sufficiently. The Standard Committee therefore, has adopted and will recommend that the neck, back, saddle and wing bows of the Partridge male shall be "a medium

shade of rich, brilliant red."

In dealing with female color, the Partridge Wyandotte Club recommended that the Standard Committee go back to the Standards of 1898 and 1905, and describe the ground color of the female as "reddish-brown." Artist Schilling stated that brown includes a mixture of black. Because of this danger of darkness, the Standard Committee sought to give the breeders what they wanted by helping them to coin a new term, and after consideration have described the ground color of the female as "deep reddish bay," in all sections except neck, which is to be "reddish bay."

Realizing that penciling is the first property of this variety, and that the best penciled females have penciled hackles, the neck of the female is to be described as penciled.

To promote the breeding of penciling in all sections of the female the Committee recommends that the lower body feathers of the male (sometimes erroneously called the fluff), shall be tinged with red.

Two other points were discussed in the committee. We present them here for the attention of Partridge breeders. If you want action on them, you can undoubtedly secure it from the committee at the meeting that will be held just prior to the Knoxville meeting. (Continued on page 698)

Black Leghorn exhibited at the Chicago Coliseum, December, 1921, by J. M. Huber, Ohio

Editorial

The Poultry Business

WHO are the poultry fanciers? We recall among our acquaintances, a doctor, a dentist, a lawyer, an engineer, a draftsman, a clerk, a salesman, a farmer, the wife of a farmer, a druggist, a railway mail clerk, a postman, a barber, a cemetery supervisor, a machinist, a plumber, the foreman of a shop, an official of the government.

Poultry keepers are recruited from all walks of life. They find a wholesome diversion in their chickens. And this variation of thought, this refreshment after toil, is good for them. A man's mind is like a field. It is wonderfully fertile. But if you crop it all the time to one thing it becomes exhausted. A rotation of ideas in the mind-soil is as helpful and important as a rotation of crops in the farm-soil.

Fancying is a hobby that provides enjoyment for thousands of people in all parts of the country. It is not merely recreation for the mollycoddle. It carries with it some of the sting of reality, just as any other vigorous game. There are eggs that do not hatch, chicks that do not thrive, hens that become infected with this or that. Every swat with the bat is not a home run; there are outs at the plate and outs all around the diamond.

Poultry for recreation calls for Standardbred poultry, for those who find diversion and recreation in fowls want a feathered race of established quality and visible beauty. They keep poultry largely for the love of it, rather than what they can make out of it. Of course, they like eggs for their breakfast. But the fancier also wants to delight in Standard size, shape of Standard requirement, and feather markings and tones of color that are the common aims of good breeders.

A fancier will spend liberally of his time, and thought, and money to improve the size, type and color of his flock, and he usually keeps at it until he has the quality he wants. On account of his deep interest in his birds, he provides good poultry houses, spades up his runs, grows greens for his chickens, feeds the best of feeds. He is even more desirous of securing good growth in his young stock than the utility poultry keeper, for the best of size, type and color can only be developed in union with steady, healthy growth.

The big breeder of purebred poultry differs from the back lot fancier only in viewpoint. The small fancier breeds for pleasure. His breeding and his showing are largely a matter of personal gratification. The big breeder sees the responsibility of rendering service, of improving the flocks of customers, of reinforcing and strengthening the efforts of those who are working with purebred poultry.

The big, successful, purebred breeder cannot afford to be ignorant of, or indifferent to, the basis of his rewards. He cannot build and permanently maintain a big breeding business if he centers his whole activity on how much he can secure out of the poultry fancy, rather than how much he may rightfully draw from service adequately rendered. To center his earning power on how to absorb, without regard to how fully he can serve; to view poultry fanciers as fellows from whom something is to be taken, rather than to view them as persons for whom a great and fine service can be done—is to commercialize the very elements of which the purebred business is made.

The folly of such a course is plain to those who stop to consider the type of men who classify as poultry fanciers, and, looking farther, see the purposes which actuate those men to breed, and feed, and rear purebred poultry.

The young breeder should view this situation, seeing clearly that a mercenary spirit, with nothing higher than traffic or barter in a commercial product, cannot be a sound foundation on which to build a purebred business. It is right that the young breeder should nourish an ambition to succeed, but that ambition should first concern itself with the work to be done, the service to be given. If profit and gain are placed first, he may find himself in competition with shrewder men than he is; but if he comprehends the constant demand for purebred poultry—eggs, chicks and stock—and then starts in to keep down his operating expenses, breed a little better quality, give a little better value, and extract from the sum of other men's labors an honest reward, his success is assured, and all the devils can't defeat him.

Inbreeding and Barrenness

Fertility is a matter of great practical and economic importance to breeders of every kind of stock. It is of immediate and personal concern to buyers of eggs for hatching, and it bears directly and everlastingly on the profits and success of those selling eggs or baby chicks.

Domestication has a bearing on fertility. Under domestication, conditions are favorable for increased egg productions, but fertility somewhat diminishes.

Care of the species under domestication influences fertility. Close housing or heavy feeding may bring about an enfeeblement of the stock that results in low fertility.

Fertility is closely associated with vitality. Parent stock that are constitutionally weak give poor fertility.

This relation of fertility to vigor has led many people to attribute poor hatches to the "abhorant system of inbreeding practised by all purebred breeders." The aversion to inbreeding is commonly so great that not only low fertility, but poor growth in the young, or any tendency of the stock not to do well, is at once attributed to close breeding. The widespread distaste for inbreeding is a dislike of long standing.

It must be recognized that much good has resulted from the system of breeding based on close blood relationship. As a constructive system of breeding, inbreeding was first employed by that great improver of British live stock, the father of modern purebred breeding, Robert Bakewell. In defense of his method, against the common prejudice, it was written in 1794:

"The greatest obstacle to the improvement of domestic animals seems to have arisen from a common and prevailing idea amongst breeders—that no bull should be used in the same stock more than three years, and no ram more than two; because (say they) if used longer, the breed will be too near akin, and liable to disorders; and if they were by chance in possession of the best beast in the island, would by no means put a male and female together that had the same sire, or were it out of the same dam. Mr. Bakewell has not had a cross for upward of twenty years; his best stock has been bred by the nearest affinities; yet they have not decreased in size, neither are they less hardy, nor more liable to disorder; but, on the contrary, have kept in a progressive state of improvement."

Following Bakewell came a number of famous breeders, Colling Bros., Bates, the Booths, Cruickshank, all of whom pursued his methods by means of careful selection and then the intensification of the blood of those chosen animals by breeding in and in. Line breeding, that is, the breeding in line from celebrated sires and dams, came to be a familiar system. Today the modern science of breeding expounds the firm belief that in the production of superior specimens of fixed type, inbreeding is the quickest and most certain method of procedure; and all modern breeders who work toward any particular goal in the breeding of purebred stock depend largely on inbreeding.

Inbreeding, however, does not result only in success. Even Bates, after building up the most celebrated herd of Shorthorn cattle in the world, through thirteen years of persistent inbreeding, went out of his own blood lines three times during the next seventeen years, to secure fresh blood. Although he held a most esteemed opinion of the superior value of his own stock, and although he did not seek to improve the form of his animals, he infused fresh blood on account of this lessened fertility.

The Duchess family of Shorthorns, developed by the illustrious Bates, was internationally famous for its milk and beef qualities, and the animals of this line of breeding were in great demand because of their superior individual excellence as measured by the highest standards for the breed. But the Duchess Shorthorns, notwithstanding that Thomas Bates was a most thoughtful and systematic breeder, were marked with barrenness. It occurred early in the history of the strain. Breeding this stock in line preserved the trait and intensified it. Although Duchess cattle commanded the highest prices for a number of years, the family ran out and has since been superseded by more fertile strains. The barrenness which was at first hailed by short sighted breeders as holding up prices since it held down the number of progeny, came in the end to be their undoing.

Bates had intensified the good points in his family of cattle by inbreeding, but also, and this is equally important, their one weakness was augmented. If the taint of barrenness is present in the foundation stock, inbreeding intensifies it. In other words, low fertility is not necessarily the unavoidable result of inbreeding; rather, inbreeding results in bringing out any such original weakness in enlarged degree. At least this is the view now generally held.

Inbreeding in its relation to fertility is today being viewed in the light of experiments that have been carried on by D. F. Jones, who has done his work with plants, at the Connecticut Agricultural Station. Plant breeders have a very large opportunity to observe heredity. While guides to practice should not be accepted wholly on the basis of plant investigations, because of the obviously different construction of plants and animals, the breeder may get many valuable pointers from the plant grower.

It is well known that wheat is a self fertilizing plant. Wheat inbreeds itself, and has done so throughout unnumbered centuries. It has not decreased in vigor or lowered in vitality as a result. On the other hand, self fertilization in corn results in marked reduction in vigor, size of plant and production of seed. It has been found that the pure-line method in corn breeding results in partial loss of power of development, and that crossbred corn frequently displays greater vigor in development than either parent.

After fourteen generations in which the closest kind of inbreeding had been performed with corn, Professor Jones concludes that when a line-bred family is lacking in some respects, particularly when it is not so fertile as could be desired, the breeder is on the threshold of a big advancement, for the defect of the line is subject to his observation and control, and if he will but stamp out the weakness by rigid culling, he will free the strain of this hereditary factor, and once freed, it will "never reappear in the progeny."

Jones has found that the nubbins which are common in every corn field, when put through a system of inbreeding, and the undesirable qualities are culled out by rigid selection, and then the inbred strains are crossed together, the result is a lot of vigorous plants, large and sturdy. "There is no inherently pernicious influence in inbreeding," he says. "If defects, such as sterility, appear after animals or plants have been inbred, they have not been produced by the system of mating, but were present in the stock to begin with, even though they had not previously been seen." From this one concludes that families that are badly affected by inbreeding were not sound to begin with.

This unsoundness in every kind of live stock is widespread. In stock raising, for instance, barrenness has been termed "a menace." It is for this reason that out-breeding or breeding the best to the best, without close relationship, will always be the general practice on the average farm or poultry plant. But for those who seek to master the difficulties that may arise from consanguineous matings, and line breed their stock for the production of strong, pure, prepotent blood lines, the closest mating should go hand in hand with the most severe culling out of weaknesses. In this way they can be got rid of, and in addition to inbreeding intensifying the good qualities, it will prove to be a purifying process.

Professor Jones is of the opinion that purebred breeders stop just short of the greatest benefit, that when lowered fertility comes to the surface, they go out of their line as Thomas Bates did, and get new blood to cover it up, whereas they should continue to inbreed, culling it out, and permanently purifying their strains.

It is well known that selection and inbreeding will fix in a strain, large size, heavy bone, wide bodies, and eliminate small size, fine bone, narrow bodies; and the strain becomes purified against littleness.

In addition to the well known values of inbreeding in fixing type and excluding undesirable characters from the strain, it may also become a corrective of inherited sterility and any other constitutional defect.

Leghorn Size and Egg Production

We are in receipt of a "free reader" about a White Leghorn hen that laid 358 eggs in 365 days. In acknowledging receipt of this announcement of extra-ordinary performance in the nest we regretted to state that "claims for egg yield had reached the point where it was impossible to separate the wheat from the chaff."

Perhaps there are those who will thank us for not printing the inspirational writeup about a new 358 egg hen, and who will enjoy reading, in its place, a good letter from a poultryman who understands the importance of egg production but has no delusions about phenomenal records—who is familiar with the smell of lice paint and seen eggs that didn't hatch yet in all the sweat and labor has not lost the vision of a good chicken. We, therefore, present the following communication from Arthur O. Schilling:

"I had quite a surprise last night while out at the farm, in connection with the new proposed standard weights for Leghorns. In order to obtain absolute records of what the average Leghorn that has modern exhibition type actually weighs, we weighed every bird in our breeding yards and when the season is over we will have these weights together with the egg records for each pen. Sorry we cannot trap all our breeding birds this year but we will have to be content with stud-mating a few females as usual.

"In our pen number 1 with the first cockerel at the Garden, we have 3 hens that weigh as follows. Number 0928, the old First Boston and second N. Y. hen 1917, 4 lbs., 14 oz.; a sister to this hen, 4 lbs., 6 oz.; another D. W. Young hen, 4 lbs., 8 ozs. There are other females that are up to and over standard weight and some are going to make hens just like these fine big specimens.

"In pen number 2, with the old Dan Young cock, we have 8 pullets. One of them goes 4 lbs., 4 ozs.; two of them 3 lbs., 12 ozs.; one 3 lbs., 14 ozs.; two others 4 pounds.

"In pen number 3, with the unplaced cockerel at the Garden Show, which you liked so well, we have our first N. Y. hen weighing 4 lbs., 10 ozs. This hen is already molting and has never stopped laying. When we weighed her we found her tail and wings well in molt. Guess she will be ready for the State Fair again.

"Our first pullet at the Garden weighs 3 lbs., 14 ozs. while she is laying very heavily and really not at her full weight on account of the steady flow of eggs she has given us all this spring. She was laying at the Garden Show.

"In pen number 5 we have 6 pullets and 2 hens. The heaviest pullet weighs 5 lbs., 14 ozs.; the next 4 lbs., 12 ozs.; two at 4 lbs., 4 ozs.; and two at 3 lbs., 12 ozs.

"Pen 4 has pullets all over weight according to the present standard scale of females, which is hens, 4 lbs.; pullets, 3 lbs., 8 ozs.

"When I requested that the Leghorn weights be raised, at the meeting of the Standard Revision Committee at Chicago last March, I had in mind these wonderful big hens and pullets. I felt that this increase was necessary to correct the erroneous impression that some of the ultra utility advocates would like to convey, that Standard Leghorns, are small, spindle legged specimens.

"It is positively an error to refer to the White Leghorn winners at our leading shows as "spindle legged," etc. It is really unfortunate

Pullets

8 to 10 weeks old

from the greatest strain of great layers. This is a real opportunity to purchase pedigreed and trapnested stock at rock-bottom prices. All are bred from 180-256 record layers. You will find that these pullets are real winter layers. 32 years of trapnesting and pedigreeing enables us to produce only birds that are practically 100% egg layers.

Sunnyside Poultry Farm

R. C. Blodgett Box 1002, Bristol, Vt.

Barrenness may be present in ordinary corn but it is rarely seen because crossing keeps it from sight. By inbreeding, the weakness appears. It can then be got rid of. Inbred strains (left and right) may still retain valuable hereditary growth quality, and when bred together produce plants that are remarkable for their uniformly large and perfect ears (center).

that so many writers gain their impressions and knowledge from unreliable sources, and thereby do untold harm and injustice in so many instances.

"I have some interesting dope on weights for Leghorn males. To be brief, I am confident that there is too much difference between the weight of a cock and a cockerel, and I know that a Leghorn cock weighing 5½ lbs. is a great big fine specimen, and that is all the weight necessary for a mature male. A male looks to weigh a pound difference, but in reality he doesn't.

"Received a letter several days ago from our mutual friend C. S. Th. Van Gink of Holland, secretary of the World's Poultry Conference held recently at The Hague. He requests me to quote him on two trios of Leghorns for B. Wilton, president of the World's Poultry Exhibition, of Holland.

"Fortunately in Holland, in the person of Theodore Van Gink, is a man who has a sane conception of what should be shown in his country as real American Leghorns. Following is a quotation from his letter:

"Mr. B. Wilton, president of the World's Poultry Exhibition, asked me to help him to import some real American Leghorns just to find out what they were like.

"The reason his curiosity has been aroused is because of the fact that I have protested against the showing of the so-called Utility Type Leghorns, under the name American Leghorns. My protest has been accepted and the name will be changed; but at the same time classes for American Leghorns will be maintained and this leaves the door open to our breeders to import and exhibit real American Standard exhibition birds."

"Had a letter today from D. L. Orr, Secretary of the Garden Show, wherein he advises me that he has cut out the utility displays from the main floor of the show he is responsible for and the show which depends upon his best judgment for success.

"It is indeed encouraging to learn of these welcome facts; and I have felt right along that, 'All the people will not be fooled all the time,' as the saying goes.

"The pity of it is, the uninitiated and inexperienced buying public who read glowing reports of high records (made over night with a sheet of paper and pencil in altogether too many cases) are the ones who are paying dearly for their experience. It is inevitable that they must awaken to the fact that their

so-called 300 egg strains will only lay as much as the average hen under ordinary conditions.

"Isn't there something that can be done to stop this increasing number of claims of 'World Egg Records Broken?'"

"The Canadian Government have a system whereby officially made records are recognized and we do not see these suspicious and fictitious records advertised to the same extent as they are in United States. I know it is a difficult problem to handle but some thing ought to be at least attempted.

"It should be unnecessary to be compelled to argue the fact that a Standard type Leghorn hen can be fed for high egg production, or bred for high egg production. It surely is fortunate that you as editor of the leading poultry publication in this country, have held your usual balance wheel of good judgment. I dislike to imagine what would happen to Standardbred poultry in this country if you too followed the gospel of preaching the 300 egg hen to your readers.

"I feel confident that the day of the common Leghorn is waning very fast and all breeders will be compelled to sell higher quality stock to their customers.

"The article by Mr. Rolf on faking methods applied by exhibitors of Leghorns in production classes was indeed a surprise and a revelation to me. This is what we need, to inform the public what is going on. Mr. Rolf surely has the situation sized up right; and it is also my opinion that the high producer has no place in the show room. Her righteous place is in the laying contests for by her actual performance alone can she be judged honestly and accurately. There is too much guess work in trying to place a first prize ribbon on a bird on the basis of those external characteristics which appear to indicate that she has been a good layer."

We join with Mr. Schilling in deploring the exploitation of egg records. Phenomenal egg records may have a news value, and they are perhaps valuable propaganda in persuading people to look into the possibilities of poultry culture. But, there is danger of them being played too hard and leading to a collapse of the very structure on which all breed popularity rests, namely, utility.

High figures are always stimulating, whether they are applied to eggs in hens, milk in cows, or dollars in swine and beef cattle. But figures can be manipulated. Then there is danger of reaction.

Swine and beef cattle men pyramided prices for pedigreed animals during years 1913, 1919 and 1920. Enthusiasm in the live stock fraternity was at a high pitch. Buyers were numerous. But sellers so vied with one another to pull off the biggest sounding sale that they bulled their own market to the point where there was more paper than cash in the transactions. A disastrous collapse followed, the bottom dropped out, and hog and cattle men who had been "playing the game" went broke by the score. All that are left today are the old-line, conservative breeders.

When more paper than eggs enter into egg records and the general public gets in the same fix in which we find ourselves, i.e., unable to distinguish an honest claim from undiluted bunk, then every record not made at an experiment station will be valueless.

That would be unfortunate. The honest breeder, working at home on his own plant, should be able to command public confidence. But, unless the U. S. Government, patterning after Canadian system, shall arrange to send an inspector to make unannounced examinations of flocks that are on test, we know of no way to combat "home grown" egg records, and the evil must continue unabated, and with increasing velocity, until it breaks up from its own fierce momentum.

In the speed of a trotting horse there is an irreducible minimum. That minimum is approximately one mile in 120 seconds. You may cut off a second or two, but beyond that you cannot go. In the egg yield of a hen, there is, likewise, a maximum.

When 200 eggers first came out and it was suggested that the figure would not stop short of 365 eggs in 365 days, the suggestion was laughed at. However, we now have with us a "358 egg hen."

That hen is not especially valuable insofar as she is the winner in a race against time

Baby Chicks

Sturdier chicks than we distribute are not produced. Standardbred chicks, produced according to natural laws, are chicks which will give results. We specialize in the following varieties and guarantee safe delivery at the quoted prices per 100:

S. C. White Leghorn\$11.00
S. C. Brown Leghorn 11.00
Barred Plymouth Rock 12.00
S. C. Rhode Island Red 12.00
R. C. Rhode Island Red 12.00
White Wyandotte 13.00
Silver Laced Wyandotte 13.00

These prices effective on deliveries of May 15 and through June, and apply on all orders for 25 or more chicks. 5 per cent discount on orders for 500 or more chicks.

Catalog free. Write for it.

Announcing The 1923 Model CANDEE Automatic Egg Turner

IT makes every egg turn every time because the whole bottom of each tray moves when hooked to the shaft lever arm that is connected with the steel rod extending through each compartment of the machine from the hand lever. Moving this hand lever at the end of Incubator turns all the eggs at the same time.

With the Candee Automatic Egg Turner it is not necessary, when turning the eggs, to "flop" the trays or to roll the eggs by hand. Therefore, this simple, practical and thoroughly efficient turner saves time, labor and trouble for the operator.

Another appealing feature of the Candee Automatic Egg Turner is, that it does not cut down the egg capacity of the machine—the trays hold just as many eggs as if not equipped with the automatic turner device.

Moving the Lever Turns All Eggs in Two Seconds in Any Size Machine

Cut No. 1 in this advertisement illustrates how simple it is to disconnect those trays holding eggs not to be turned—simply unhook the shaft lever arm, and the steel rod extending through the front of compartment will move without turning the eggs in any tray disconnected.

Cut No. 2 shows how simple it is to take apart and put together the three parts of the Candee tray. The moving bottom is covered with galvanized hardware cloth which is easy to clean, and being galvanized it does not rust. The three parts of the tray are the wooden tray frame, moving metal bottom and galvanized egg rack.

The Candee Incubator including the simplest of all automatic egg turners: double heat control (automatic regulator at heater and automatic regulator at each 300 egg compartment): proper ventilation without robbing the eggs of their original moisture, and truly sectional construction making it possible to enlarge the machine any time without disturbing the original installation, is your one best investment without question.

Write today for free catalogue that explains all about the Candee and gives the names of hundreds of successful operators.

Breeding Birds at Reduced Prices

Each year during the summer months I offer at reduced prices a limited number of choice breeders to make room for growing stock. These birds are rich in the blood of my great heavy laying prize winners, and are highly desirable to carry over for breeding and showing next season. Order early to insure delivery.

Hatching Eggs Now Half Price

Experience has shown that June is one of the best months to hatch prize winners. Don't let the season pass without buying hatching eggs from my breeding pens that have proven their ability in producing show birds and heavy laying stock. Send for free mating list containing full particulars.

TRAP NESTS

of Neimann Make are Best

Galvanized Iron nests are positively sanitary and in purchasing such a nest you are rendering yourself a service that will pay for itself in a short time. Why run the risk of having your birds become infested with lice and mites when you can buy a galvanized trap nest that is positive proof against parasites? The same is true of every Neimann product. Our Products are all made substantially of galvanized iron, are easily taken apart and packed for removal and the prices at which we sell them make their purchase the most economical way of securing fixtures. Write today for catalog showing prices of these attractive poultry fixtures.

or record. A record making hen is only of particular value insofar as she can lift the production of her descendants to dependably higher figures. Improving the general average of production is more important than a phenomenal record that passes out with the passing of an individual.

Average records are gradually, slowly going up. Ten egg laying contests have been held at the Connecticut Agricultural College at Storrs. The first half year of the eleventh contest is over. In that half year, now ended, 13 pens of ten birds each, have laid from 1002 to 1197 eggs per pen. In previous laying trials at Storrs, not more than half a dozen of the 100 pens entered, have finished the year with a score of 2000 eggs for each pen, or 200 eggs for each bird, but this year the management takes pleasure in announcing that "now there are excellent prospects that nearly double this number of pens will finish the current contest with the splendid record of 2000 eggs for a pen of ten birds."

That is good news, for it reports progress. It is reliable, for it comes from an unselfish source. It is educational, for it teaches that the oldest egg contest in America is still seeking the 200 egg level.

Are 200 eggs per hen per year the end to aim for? It would seem that this is a high yet fair goal. The Connecticut egg contest is able to annually get six pens out of a hundred to reach it, and this year has a chance of getting 13 pens.

Such information is helpful. There is so much actuality in the poultry business that glowing accounts are sometimes painful to men struggling with every day problems.

A word in regard to weights best suited for egg production. It has been stated upon good authority that the pullets that have done best in the Canadian contests were of approximately Standard weight, 3½ lbs. This is good theoretical argument against an increase in the Standard weight of pullets from 3½ to 4 lbs. The practical side of it is that taking the country by and large, the average exhibition Leghorn female is too small to suit the men who are making their living out of white eggs for the commercial market.

The Leghorn that stands up under every day work on the commercial farm, is a bird of good body substance, waxy comb and full under line.

We stand for the high type of White Leghorn that is winning at the New York and Chicago Coliseum shows. It is a bird of substantial size, as Mr. Schilling sets forth by the weights he gives.

We do not favor a little, neat comb, secured by breeding a small head and skull, such as we saw on some of the winning White Leghorn pullets at the last meet of the National White Leghorn club at Milwaukee. We do not approve of selling at \$50 each, little toppy, cockerels, with scarcely more to recommend them than neat combs, concave backs and low tails; being deficient in size and substance of body, with their wings materially longer than their underline. One utility breeder who dabbles in "the fancy," had a lot of such birds for sale at the Chicago show at \$50 each. They were not worth that much money—not by a long shot.

If little, fine boned pullets, and struttly, little concave backed cockerels that are only a "flash in the pan," are the Standard Leghorn, then we want none of it. Such types cannot deliver for the man who makes his bread and butter out of hens; they cannot consume enough feed, for their body capacity is too small, and they cannot lay a high enough percentage of 2 oz. eggs, that is, eggs of marketable size.

The type that does deliver has size enough to give a good frame, has substance enough to digest and assimilate large quantities of feed; and yields an egg big enough for the market.

Some say: "The 3½ lb. pullet is all right; let's get them up to that weight, for the trouble is not in the present Standard weight, but in birds not being up to that weight." Good argument perhaps, but it does not mean anything. How are you going to get all pullets up to 3½ lbs. when you allow a pound before you disqualify,—when a 2½ lb. pullet can be cut only 2 points?

Let us make the pullet weight 4 lbs. as the Standard Committee recommends. Even then a 3 lb. pullet can get under the rope with

DAY-OLD Chix-Dux

1887-1922

Our EARLY MATURING NIAGARA STRAINS reach full development from three to five weeks sooner than the average strain, having been mated by the Hogan test along these lines for over sixteen generations. They are of special value to the poultryman or woman who purchase their chix at a time when weather conditions are most favorable for the successful rearing of chix with the least possible time and labor.

Burt, N. Y., Mar. 8, 1922

Gentlemen: I have 34 pullets raised from chix purchased of you last season. They commenced to lay in November and have averaged 21 eggs per day all winter. They have done the best of any chix I ever had. THEY WERE JUNE HATCHED CHIX. Yours, Mrs. G. C. McCarthy.

Buffalo, N. Y., Aug. 17, 1921

Gentlemen: On the fifth day of August one of my pullets raised from chix purchased of you this season, laid her first egg. She was just THREE MONTHS AND TWENTY-FIVE DAYS OLD and I consider this a world's record for White Rox. Very truly yours, J. E. Donovan.

White, Buff and Brown Leghorns, White and Barred Rocks, White Wyandottes, R. I. Reds, Anconas, Black Minorcas; Pekins and Indian Runner Dux all bred with painstaking care along the lines above mentioned.

SUCRENE BUTTERMILK FEEDS for POULTRY

Are
Something
to Crow
About

Rich in vitamins that build vigor, stamina and double egg production. These two buttermilk feeds are making money for poultry men.

Sucrene Buttermilk Egg Mash puts hens in excellent laying condition and enables them to maintain a super egg production at all seasons. **Sucrene Buttermilk Chick Mash**

helps raise the greatest possible number of chicks, eliminates all chances of bowel trouble and develops pullets rapidly to early laying maturity. In addition to offering the poultry world these two money making feeds, we have also produced a real book—"For Better Poultry." Written by a prominent poultry expert, it gives unbiased facts on breeds, houses, incubating and brooding. Describes diseases and tells how to avoid them. Tells how to feed for heaviest egg production and to raise the most chicks from every hatch. Sent absolutely FREE POSTPAID to boni-fide poultry raisers on request.

Write for it today. No charge

AMERICAN MILLING CO., Dept. 1 Peoria, Ill.

only a 2 point cut; and a 3½ lb. pullet would be cut only 1 point.

Under a 4 lb. Standard weight with more than 1 lb. to disqualify, the Standard is indeed lenient. Unless you are able to adopt and apply such weights in all shows, as they could be today adopted and applied in New York and the Chicago Coliseum, then the exhibition Leghorns in the hands of the average breeder are too small, and the quicker he finds it out, the better for him.

The White Leghorns that are winning at New York and Chicago meet these requirements of utility, with a world of breed quality heaped on for good measure. The Standard Committee has sought to make them the Standard. They are the ideal. The next best thing is the utility Leghorn, for it also has size, substance and underline, lacking only in finish. The poorest of the three, decidedly so, is the bird that is all finish and deficient in substance.

The Standard Committee endeavored to make the Standard exhibition Leghorn the equal of any Leghorn in the world. The committee increased the weights so as to assure a bigger, more rugged body; it reduced the value of the comb from 10 to 6 points, so that comb would be no longer the most important section in a Standard Leghorn; and it wrote the word "underline" into the Standard text to emphasize that there was something more than a topline in a bird.

The Chickens.

It is not too late for chickens. Give them a run on green grass, separate from older broods, and bestow upon them the same enthusiastic care that you gave the earlier chicks, and next January you will not be able to distinguish your June 15th pullets from those hatched April 15th.

Lice are bad in summer. Anoint heads of newly hatched chicks with olive oil. Dust weaned chicks with louse powder, applying a pinch of it under each wing and rubbing same into feathers. Cut top off can and use fingers.

Few farm flocks are fed for eggs in the summer. Animal food is exhausted. Feed milk, skimmed or sour, or buy meat scraps. Layers require large quantities of animal protein. To prolong laying and delay molting, feed milk or meat to take the place of worms and bugs which the range no longer supplies.

Feed growing chicks all they want. Cheat in feed and nature will cheat in growth. Better to cull hard, fry and eat, and give the remainder the benefit of full feeding.

Open air housing is essential. Young birds will not thrive in close quarters. Better by far to let the rain fall on well feathered youngsters than to roost them in close coops.

Green stuff is as necessary food for young and old chickens as hay is for cows. Grain and mash are concentrates. Provide the needed bulk in grass, lettuce, chard, dandelions.

Small brood coops should be moved daily to fresh grass. Then the hen and chicks will not spoil the lawn, and poisons thrown off by the body in droppings will not be picked up by the chicks and spoil them.

Roost young birds of big breeds on four inch studding, broad side up, to prevent crooked breast bones. Of if they roost in swaying limbs of trees or shrubs, they will grow straight.

Where chicks are started on green grass and fed milk, leg weakness does not occur.

Youngsters that do not eat well probably haven't enough ventilation, green stuff or exercise.

Examine the dropping boards in the hen house. Watch out for round worms. An epidemic of worms is as bad as roup.

If hens show a little diarrhea, one leg is lame at hock joint, and there are occasional deaths, examine liver and intestines of one that is growing light, for tuberculosis lesions.

Do not expect good growth and fast feathering if you feed only grain. Chickens require animal food, especially when confined.

A 33 Day Record.

I have 100 White Leghorn chicks hatched April 7, and 2 of them started to crow May 10 which makes 33 days. They are a little over one-half pound in weight.

M.

—A. Whitty.

LICE?

With their scissor-like jaws they bite constantly—thousands of them at one time—irritating the fowl almost beyond endurance, robbing it of blood and rest, cutting down its vitality and rendering it an easy prey to disease. No wonder lousy chickens never do well for themselves or their owner. When a fowl seems restless and picks at itself, look for lice.

Go After Lice Quickly

with Conkey's Lice Powder. It comes in a handy package with a sifter top, making it easy to dust the powder thoroughly into the feathers. Body lice don't like it—help to keep your flock free by occasional dusting.

Conkey's Lice Liquid helps to rid your fowls and houses of mites. For painting roosts, fittings, nest boxes and wherever mites congregate. We guarantee it to satisfy you.

Conkey's Lice Fix is an ointment—a new and very effective way of fighting body lice.

Conkey's Head Lice Ointment helps to overcome the head lice that "eat up" baby chicks.

Insist on Conkey's. If your dealer cannot supply you, write us. Send 6c in stamps for Conkey's Big Poultry Book.

CURRENT NOTES AND COMMENT

Turning the Eggs.

Experiments conducted at the Massachusetts Agricultural College showed that six turnings of eggs each day increased the number of normal chicken hatched and decreased the number of those deformed. By setting a hen in a glass nest, suspended above the floor, and by marking the eggs in that nest, it has been possible to count the number of times the sitting hen turned her eggs. It was found that she not only rotates the egg on its long axis, but changes its direction, pointing or end for end, and moves the egg from one location in the nest to another.

Henry W. True, poultryman in Massachusetts, reports that he improved his hatches by turning eggs five or six times daily during incubation. He also found the chicks hatched a half day sooner. John H. Storer, another New England poultryman found that between 400 eggs turned twice a day and an equal number turned five times, there was a difference in the hatch of 12 per cent in favor of the five turnings.

Eggs Hatch in Fifteen Days.

A writer in Poultry World, London, states that experiments were begun in 1912 and continued until 1916, to determine what result the application of X-Ray would have on shortening the period of incubation. It was found that the incubation period could be reduced to 15 to 17 days and produce chickens as satisfactory as those produced naturally in twenty-one days. The temperature maintained varied between 101 and 105 degrees. During the process of incubation the eggs were moistened with warm water and aired in the usual way. The fertility ran from 55 to 65 per cent. Ninety per cent of the fertile eggs were hatched. At the age of six weeks the chickens that had been incubated in the 15 to 17 day period were said to be larger, stronger and more robust than hen hatched broods of even age. The X-Rays were developed by the use of 50-100 milligrammes of radium bromide, but the contributor maintains silence on the cost of this radium.

* *

The Young Breeder Will Learn.

The great breeders are not all of the old school. Neither are they a favorite few to whom nature has whispered secrets. The young breeders of today will be the great breeders of tomorrow.

Dan Young was a master breeder whose constructive work is stamped in every good flock of White Leghorns of the present day, yet he never owned or showed such quality as was cooped at New York last year. Younger men who hesitated, blushed with bashfulness,

The 100% Satisfactory NEWTOWN

The present season has again demonstrated Newtown Incubator Supremacy. Thus history repeats itself. For many years the Newtown has stood first, as judged by results. Poultrymen everywhere know the Newtown as the incubator that **"hatches the most chicks, the best chicks, with least labor and at lowest cost."**

Newtown Supremacy is due to perfection of design and honesty of construction. The machine incorporates the essential principles of successful incubation—it has been refined and perfected through years of study and investigation, backed by wide experience—it is built of the finest materials by expert mechanics—it is fitted with the best of labor-saving, results-giving devices—it gives 100% satisfactory service for many years.

New types of incubators come and go. Inexperienced buyers make expensive experiments, then turn to the time-tried Newtown for real results. Year by year Newtown Sales increase solely because of Newtown Merit.

If you are buying your first giant incubator, order a Newtown and get the best machine first. If you must replace present unsatisfactory equipment, order Newtowns and be sure of satisfaction. If you are increasing your incubator capacity, order Newtowns and learn what real hatching results are.

It isn't too early to decide and act. Our special inducements for early orders will interest you. It will pay you to investigate NOW. Write us at once—tell us what egg-capacity you will need. We will write you promptly and fully, and tell you something that will be greatly to your advantage. Of course you'll want a Newtown next season. Let's go!

and feared to express an opinion on his birds in the days when he walked into Madison Square Garden wearing a black felt hat with a halo around it,—younger men who were confused by the uniform excellence of his birds in the days when he held the Standard exhibition Leghorn tightly clinched in his hand,—are today the leaders, touching new heights and achieving new victories.

And all because they have been mating, rearing, pedigreeing and studying their birds. That is the substance of success. No new found formula will prove a perfect substitute for it.

* * *

A Good Example.

The Rhode Island Red Club of America received \$6,238 in dues last year. Secretary Card advises that the club now has 3,500 members. Each member pays \$2 a year dues. A big drive is under way to double the membership. Three cities have each bid \$1,000 to get the Rhode Island Red Club show.

What is the secret of this unparalleled success? That is found in the following two paragraphs, taken from the leading article in "Red Hen Tales," which is the title of the Club's year book for 1922:

"Every experienced Red breeder should help the beginner to get results. It is back number stuff when one follows the policy of 'carrying secrets to the grave,' and tries in this advanced age to succeed on the narrow lines of monumental selfishness and fear that he will lose his deserved place among men by co-operating to the fullest extent for the advancement of his own line of endeavor.

"Don't be shortsighted fellows. You will eventually slip if you don't wake up to the importance of this fact and the breed will be held back in just the proportion that Red breeders fail in their duty to the whole mass that are and can be interested. Get the Reds to going on a bigger and bigger scale by constructive work and there will be more business than you can take care of."

It is because the Red men take to heart such advice, and put it into practice, that the Rhode Island Red fraternity has resolved itself into a Booster Club.

* * *

Breed Characteristics.

England now has Exchequer Leghorns. They look like Anconas. But since distinctive breed characteristics are not a necessary attribute to a breed before it can get into the English Standard, there is no reason why this mottled Leghorn cannot get along very well over there. A few old breeders, however, lament the confusion that is resulting from the multiplication of varieties, and Thos. Nicholson writes to the Poultry World, London:

"Now then, Mr. Originator, it is your turn to take a breath, make it a deep one, and then if you know the origin of the breed which you are extolling, for the benefit of enthusiasts, tell them, and then name a Standard. Perhaps there are not many secrets to reveal in relation to the Exchequer Leghorn, and doubtless it would be unwise to let the public know that they are being offered an old breed under a new name, and at an enhanced price?"

* * *

Purdue's Egg Show.

There were 820 entries of eggs in the egg show at the Indiana Agricultural College, Purdue University, May 1 to 4. It was the fourteenth annual egg show to be held at Purdue, the first event having been staged in 1908, with eight entries. Thirty-eight silver cups were offered this year.

Professor A. G. Phillips of Purdue is the daddy of the egg show. He has demonstrated its value. In summing up the purpose of the egg exhibition, he says:

"The object is to encourage the production of more and better eggs; to give an instructive exhibition of the best methods of sorting selecting, and packing eggs; and finally, to bring people in closer touch with the work of the University along agricultural lines. By seeing the show, or by entering eggs, one sees the importance of uniformity. Uniform eggs will bring more on the large markets. This type of product may be secured by keeping only one kind of hens, and culling

LADY PURITAS

HALF PRICES on Eggs and Chicks

from PURITAS SPRINGS WORLD'S GREATEST

Trapnested Winter-Laying Strain of

S. C. WHITE LEGHORNS

THEY LAY IN WINTER You want a laying strain of Single Comb White Leghorns. They are the most profitable. Puritas Springs Leghorns are known the world over for their heavy laying. They lay in Winter as well as in summer. They lay large white eggs, which bring highest market prices. Get our eggs and chicks now at half price. We will make prompt delivery. 8 to 12 weeks old pullets are also a good buy. We have a grand lot of them, hundreds of them are sold but we have thousands. But remember, they sell like hot cakes. Puritas Springs Leghorns have been trapnested for over 10 years without missing one day. Is it any wonder that they lay? Our catalog tells all about them. Send for our half-price list on eggs and day old chicks. Please mention if you have our catalog.

PURITAS SPRINGS POULTRY FARM, Box F111, Avon Lake, Ohio S. J. SCHENK, Owner & Mgr. Formerly of Berea, Ohio.

LADY LAYER

Quality Baby Chicks

20,000 BREEDERS, bred exclusively for high egg production, and standard qualities. Every fowl selected by Hogan Test. Our Leghorns, Rocks, Reds, Orpingtons, Wyandottes, and Anconas bred to capacity of 200 Egg hens.

LARGE PRODUCTION enables us to sell quality chicks at price of common hatchery product. INCUBATOR CAPACITY 10,000 eggs each day, all eggs used are from these flocks.

Our 32-page illustrated catalog is free, and gives valuable information on care of chicks and poultry.

Hatching eggs in season at very reasonable prices. Chicks shipped by parcel post, prepaid, live arrival guaranteed.

HANSEN'S RUSSIAN ORLOFFS

Undefeated Champions of America. Still stand supreme, winning at the Chicago Coliseum, 1921, 1-2-3 Cocks, 1-2-3 Hens, 1-2 cockerel, 1-2-3-5 Pullet. This win at one of the World's Greatest Shows with the records made in the National and American Egg Laying Contests proves the worth of these great Cold Weather Fowls. My new 1922 booklet describing the Orloff mailed free on request. Am now booking egg orders for spring delivery.

DR. M. A. HANSEN, IMPORTER AND BREEDER, OSAGE, IOWA.

Growing Profits

YOU never worry a bit about the healthy appetites of your chicks when they are growing rapidly. You know you will get your money back. It is the slow-growing birds that eat holes in your pocket-book. Rapid growth at low cost is always the result of proper feeding—and for the half-grown chick, that means

DICKINSON'S GLOBE GROWING MASH

It builds up chicks in a natural way. Easily digested and readily assimilated. Contains nourishing animal, cereal and vegetable proteins.

Whether you keep ten or ten thousand chicks, you will find GLOBE GROWING MASH economical and satisfactory. It is perfectly balanced, palatable and *gives results*. You are sure of profits because of the rapid growth and perfect health of your flock. The rapid development of the flock with the old-time worries removed is a great satisfaction, and you will enjoy it.

Feed Globe Growing Mash in a hopper; let young fowls have access to it at all times. With vigorous exercise they will require much nourishment to keep up constant growth, but they will not overfeed. Be sure they exercise. That can be induced by scattering Globe Developing Scratch in the litter twice daily. They will work for it and strengthen their bodies to resist disease.

It will be only a few weeks before your pullets will be ready for Globe Egg Mash—the great egg producer.

Your dealer carries the full line of Dickinson's Poultry Feeds—or he will get them for you if you ask. There is no "just-as-good."

Dr. David Roberts Poultry Tablets

A combination of sulphocarbolates of calcium, sodium and zinc for the treatment and prevention of White Diarrhea and all intestinal infections of baby chicks, as well as poultry in all stages of life and productivity. Drinking water for poultry should be medicated to overcome and prevent disease. The annual poultry loss by disease is stupendous—over 50 per cent.

Save Your Chicks

Serve in fresh water. Aids digestion. Permits food to nourish them through their babyhood, the non-productive period when hardy bone and strong muscle is needed to give them a good start in their race for the laying period. They will reward you manifold later on. Give them proper protection and you will find there is big money in poultry. Sold in tablet form.

50 Tablets 50 Cents

Poultry will drink when too sick to eat. Baby chick organs are peculiarly sensitive. They need something to ward off disease, particularly that most dreaded and destructive disease white diarrhea.

A Tablet A Day Keeps Disease Away

One package, 50 tablets, enough to medicate 50 gallons of water, a most effective and economical preventive, for only one cent a gallon. Use Dr. David Roberts Poultry Tonic, Louse Powder, Poultry Cholera Medicine, Poultry Roup Paste and Disinfectant, all known and tried prescriptions. Sold by our druggist, dealer, or direct.

Dr. David Roberts Practical Home Veterinarian, a veterinary doctor book, regular price \$1.00, tells you how to treat your own poultry, also describes our 44 prescriptions—a prescription for every animal ailment. We will tell you how to get it FREE.

Our Special Introductory Offer

Send 25 cents, just one-half the regular price, for one package Dr. David Roberts Poultry Tablets, sent you postpaid, providing you give us the name of your druggist or dealer.

HEALTH

them as often as convenient. It is necessary to select one certain type and then breed to that type."

There were nine different classes in which the eggs were entered, including one for commercial poultry keepers and one for fanciers. Why a "fancy" class?

If any fancier claims a handicap because he has not the large number of eggs from which to select that the commercial poultry man has, Professor Phillips should convict him with the slogan of the fancy "quality not quantity." If any fancier is sacrificing quality of egg as indicated by size, color, form, texture and fullness, he is not worth bothering with; he is eliminating himself as a breeder, for no strain will continue vigorous that is incapable of furnishing decent packages for the life blood of its own young.

Instead of opening classes for eggs from commercial flocks and fanciers' flocks, instead of urging poultry shows to have exhibition classes and production classes, let us always work to the end that the Standardbred birds, and eggs from those Standard birds, shall be, in every instance, all that they should be.

A distinction between fancy and utility is a fundamental wrong. The Standardbred bird should always represent the most useful and productive type. Otherwise there is no economic reason for its existence or its more extensive breeding.

* * *

The Diversified Small Farm.

Harry G. Forster has an article in this issue that is along sound lines.

At the University of Illinois the farm management office has figures to show that a small plot of alfalfa was the most profitable crop one farmer grew on his farm. That doesn't mean he should put his whole farm to alfalfa. He must go on with his cattle, his pigs to eat up the waste and convert his corn into pork, his alfalfa to swell his turnover, his hens for eggs and market.

The one crop farmer is always in greatest danger of disappointment and loss. Why not plant fruit trees to shade the poultry? Keep bees to fertilize the fruit blossoms? He should have a big garden; a few sheep to keep down weeds on the range; a cow for milk; a litter of pigs; some corn for feed.

It is comparatively easy to pick up the rudimentary knowledge necessary to handle the small, diversified farm. In poultry farming, too many folks want to lead off and make a big showing. Poultry and small farming should be a living, not a show.

H. H. Stoddard Passes Away.

We regret to learn of the death of H. H. Stoddard, who passed away at the age of 85 years, at the home of his daughter in Kearney, Nebraska, April 21st.

Mr. Stoddard was a charter member of the A. P. A. He first wrote a series of poultry articles for the Orange Judd Farmer which were afterwards published under the name of "The Egg Farm." About 1874, he began publishing the "Poultry World," at Hartford, Conn., which he continued to edit and publish for over 20 years. Then for several years he gave up poultry and devoted himself to live stock in Nebraska. In 1910 he went to Texas for his health and again went into poultry raising and incidentally wrote for a number of papers on poultry raising in the South.

In October, 1911, he accepted the position on the editorial staff of the Journal as Southern editor. He has not been able to write for several years, but his mind was clear until the last.

Mr. Stoddard was one of the leading lights of the poultry world for many years, and helped to lay the foundation under what we of today know as the purebred poultry industry.

Rogers' Leghorn Farm, South Road., Elgin, Ill.

Plugging Up the Hole in the Egg Dollar.

(Continued from page 666)

by the reports from 165 farms scattered throughout the state, was 32c per dozen.

Mrs. F. A. Millard of Kingsville, Missouri, keeps approximately 500 hens of two different breeds. She handles Buff Orpingtons to give her a heavy winter egg production and White Leghorns to keep up the egg supply during the spring and summer months. Mrs. Millard has a special outlet for her eggs through one of the large department stores in Kansas City. For the year ending January 1st, 1922 her net price, after the cost of packing and shipping was deducted, averaged 37c per dozen.

Thos. W. Edwards of St. James, Missouri, maintains a moderate sized White Leghorn flock and specializes in the production of quality eggs. He was a former resident of St. Louis and has a personal acquaintance with a number of families in the city who appreciate quality products and are willing to pay a premium for dependable goods. Mr. Edwards ships by parcel post direct to several families in St. Louis. His average net price for 1921 was 46 cents per dozen.

The table on page 666 shows the average net price for eggs for 1921 by months as reported by Mr. Petar, Mrs. Millard, Mr. Edwards and the 165 demonstration flock owners scattered throughout Missouri.

A comparison of the prices by months for the different selling systems shows that, except in the case of Mr. Edwards who has a definite contract with his customers to pay him 20c a dozen above St. Louis wholesale quotations, the variation in the net returns were greatest from July 1st to February 1st, and for the months of February, March, April, May and June the average difference was very small.

These figures indicate that beginning about July 1st the producer who has real quality eggs may well afford to seek a market that will pay a premium for quality products and that he can afford to send his eggs to such quality markets during the Fall and Winter months. From February to July differences between local quotations and the net returns from other points probably will scarcely pay for the trouble involved in shipping eggs.

Many poultry keepers can find special individual outlets but for those who cannot the eastern commission firms offer an opportunity for selling on a quality basis. Several New York and Boston commission firms now make active bids for case lot shipments direct from producers.

Success in the Business of Hatching Chicks.

(Continued from page 667)

ing and any one wishing to set eggs can bring them to the hatchery and have them turned into day-old chicks the same as farmers used to take their wheat to the mill and have it ground into flour. Many persons near by take advantage of the custom hatching because it saves them time and trouble at that season of the year when their farm work is in full swing. The certainty of the mammoth incubator as a hatcher is so well established, that poor hatches are known to be due to poor or weak fertility in the eggs supplied, so few complaints are heard.

The weight of 40,000 eggs, the present full capacity of the hatcheries, is two tons and a half. Ordinary eggs as mentioned before, are paid for at five cents above market price. Higher grade stock is paid for according to the grade of the flock. Ordinarily twelve kinds of chicks are hatched and marketed: White Leghorns, Brown Leghorns, Buff Leghorns, Rhode Island Reds, Barred Rocks, Black Minorcas, White Rocks, Buff Rocks, White Orpingtons, Buff Orpingtons, White Wyandottes, and Black Langshans. These are the Standard varieties. Other breeds are sometimes handled but the average chicken raiser wants one of popular kinds.

A necessary requirement for selling eggs to the hatchery is to have chickens of only one breed, or if more breeds, each kind to be penned. This system has a tendency to cull out all inferior stock and in consequence the poultry standard throughout the county has been raised.

Operating in a small town and having an adequate supply within the county, adds greatly to the splendid hatching results of the Smith Bros.' Hatcheries, as well as to their successful delivery. This is a favorable condition that exists in all sections of the great agricultural parts of our country.

With the opening of the season of 1921, the firm adopted for its slogan, 300,000 day old chicks for 1921. They exceeded that amount, and still the business grows this

If you raise Chicks the above real photograph will convince you of the vital necessity of The Conkey-Norwich Chick Feeder

Feed outside—protect the feed in this wonderful device from Showers, Sun, Rain; from the older birds and from pollution—and watch your chicks develop. As one user expresses it: "The growth of my chicks this season, fed outside in your feeder with Conkey's Growing Feed, is astounding."

Pres. International
Ancona Club.

year. The chicks are shipped to every state in the Union and the hatcheries have received orders from Mexico and Canada, which, however, they do not fill. Most of the chicks go out on Monday and as many as 10,000 day old chicks leave the hatchery in one day. Smaller lots leave during the week.

Day old chicks travel by parcel post. They are placed in pulp board boxes which have a capacity of from 25 to 100 chicks. There are air holes at the top and sides of the containers. No food or water is provided the tiny travelers on their journey. Their tender feet are protected by a bed of excelsior. Inside the top of every chick container that leaves the hatchery is posted proper feeding instructions for baby chicks. On a recent shipping date when the hatchery was visited, the day's hatch was packed and billed ready for shipment and the labels visible read: New Orleans, La.; Atlanta, Ga.; DuQueen, Ark.; Farmington, Mo.; New Athens, Ill.; Birmingham, Ala.; Prairie View, Kan.; Tawas City, Mich.; Milton, Fla.; Hyde, Colo.; Sapulpa, Okla.; Compton, Calif.; Marion, Ohio; Red Oak, Ia.; Oconomowoc, Wis.; Albuquerque, New Mexico.

The fast occasioned by two days of travel does not in the least impair the strength of the chicks. A greater menace to their safe delivery is in being fed by kindly baggage men and mail clerks.

So successful have the shipments been from the Smith Bros. Hatcheries, that they guarantee a 100 per cent safe delivery.

One of the reasons that has caused the growth of the chicken industry is the fact that it has been learned that farm range is not necessary for the production of

Allen and Floyd Smith, Missouri, who are making a business of hatching chicks.

healthy, profitable fowls. Many prize winners and record layers are raised on town lots or city back yards.

Back yard flocks are increasing in numbers all over the country. And the owners find it easier to buy chicks or partly grown chickens than to do their own hatching. On the farms, the colony brooder has encouraged chicken rearing. Two hundred chicks can be purchased at one time, put under a big canopy hover, in a brooder house, and the entire year's chicken crop is thus handled in two or three such broods. In the old way with 10 chicks to a hen, growing the season's chicken crop was not only more limited but more troublesome. Now, the farmer's chicks are of one or two ages, require uniform care and feed, grow uniformly and reach laying about the same time. Verily the mammoth incubator is booming poultry raising, and the opportunities in the hatching business are open to thousands of people, in every poultry raising section, every farm community, and hatcheries should be established in every county seat and trading center.

With the expansion of their industry the Smith Bros. keep right on studying and improving their plant. Smith Senior's retail experience taught him that a satisfied customer is a permanent customer. Price lists are gotten out each month; the total circulation of these lists and semi-annual catalogs is more than 20,000.

The Smith Bros. are an intensely enthusiastic pair. They go straight at the goal. They fairly boil over with enthusiasm over their great project and have thrown themselves into their work like a football match. It is hard to say which one is most indispensable to the business. One thing is sure the combination is hard to beat. "We are just in our infancy," they will tell you. "Watch us Hatch."

Record Growth.

I see in the May number where Harry D. Barnes from California tells about his White Leghorn crowing. I can go him one better. Mine crowed at 24 days old; weight 1 lb., 12oz. at 7 weeks old.

Mo.

—Mrs. P. U. Hammonds.

STURDY- as OAKS

Order "Famous" baby chicks while summer prices prevail. This fall, late, the pullets will be laying—and you may well be proud. The "great oak" sturdiness of my thoroughbred beauties carries them through the most severe winter weather. During the keenly cold months they make some of their best laying records.

With the coming of summer I hold my

Annual SUMMER "SAIL"

and in a few weeks receive, at special prices, orders enough to take all the balance of my hatching eggs and baby chicks. Early request is necessary if you would be sure to secure yours. A postal brings the special circular.

A Combination Brooder and Laying House.

(Continued from page 669)

I face the house to the south if I can, but if not, then to the southeast, a little more south than east. I want my ground to lay so I can use a double yarding system, one yard in front and one at the back. Then if my house faces the southeast, the sun will shine a part of the day a little on the yards at the back, a little in the morning and a little in the evening; and the ground will not be as cold and damp in the early spring as it would be if the sun could not get to it at all.

I first use the front yards for the chicks when very young, as they can get more sun. When they have eaten up all the green stuff, I transfer them to the back yards, and re-sow the front yards in oats. I want these yards to be 75 to 100 feet long, and as I have four bunches of chicks in this house of 500 each, I have a yard 24x100 feet long for each bunch. With 500 chick units I can get the entire 2000 chicks into the house in three minutes if a storm comes up.

My design of a house is the simple shed roof type and it is in the way I finish the front and back that makes it different from all others.

I built it 6 feet high at back and seven feet at front, so that they will not be like a barn and filled with straw to keep the fowls from getting their combs frozen in the winter season. Straw gets saturated with moisture from the fowls' breath and becomes damp, hence you find the rafters dripping with moisture every morning in the winter season. This straw makes the finest place in the world to breed rats and mites.

I build my house in 12x14 foot sections, that is, I call every 12 feet in length a section. I will describe two 12-foot sections. This gives a room for the brooder stove and a feeding and cool room, and each additional section is constructed just the same.

I use a wood floor, concrete is not as satisfactory for me. I have been employed where all concrete was used, and I noticed the litter was always damp and had to be changed often. If one wants healthy fowls they must have dry litters to work in.

The Front and Rear.

The construction of the front and back are the special features, I use a 2x6 for a sill, set on edge; and 2x6 for joice. After I get the sills and joice in, I nail a plank of flooring along the outer edge to nail my uprights to. I use nothing but very straight 2x4 for the studs, and front, and I use tongue and groove house siding for the sides.

I measure the sill to the center, then each way from that center about 17 inches, this being the width of a 34 inch window sash, of six lights, 10x12. I place a stud, one each side of this space, where the window will be, so that the sash will slide up and down. Then I divide the distance on each side of the window and place another stud in the center.

Now I board up my front 15 inches from the floor, and cut in between the studs a 1x6 board, and let it project 1½ inches over on the outside. This is a water board, or sill, for the windows to come down on. This board should have a decline outward of about one inch to carry off the water.

From this board I measure up 22 inches on the studs, and commence there to put on the siding, up to the plate at the top, but do not let the siding extend beyond the top of the plate. Now this 22 inch opening is covered on the outside with 24 inch, 1-inch mesh wire. Before this wire is put on, I cut some pieces of 1x4 and nail on to the face of the studs where this opening is. It will extend out on each side of the stud about one inch. This acts as a flange to keep the windows in place; also the wood doors that are to cover up these openings between the studs. These doors slide up and down between the studs, same as the windows. These doors are kept in place with laths, or regular window stops. A catch stop is nailed on the stud at any height to keep the doors and windows open, as high or as low as I want them. This front is rain and wind proof, and that is the reason that it can be used as a brooding house.

The rafters are set directly over the studs, and where the rafters set on the plate there will be an opening of about three inches. This is my means of ventilating when I use it as a laying house. It is about as near perfect as one can find. When I use it as a brooding house I cut in some 1x4 between the rafters to close this opening so as to keep the warm air in the room, otherwise it would escape there. After the stoves are removed I remove these pieces so that all foul air can escape, as it will when used as a laying house.

The rafters project over the front seven inches. On the end of these I nail a 1x6 board as a cap, to keep the wind and storm from blowing in.

Sure Quick Death for Rats and Mice

Remarkable Triple Strength Virus Kills Every One—Not a Poison

Marvelous French Discovery

Rats are your enemies. They destroy your buildings, eat your grain, kill your poultry, start fires and spread disease in every community. You need no longer suffer these losses—You can now, in a week's time easily kill every rat, mouse or gopher with Rat Virus, the great French discovery. Our triple strength virus is the most powerful concentrated deadly virus known, the only sure, safe rodent destroyer.

Triple Strength Virus is absolutely safe to use anywhere—positively not a poison. No danger to chickens, horses, cattle, hogs or dogs. Harmless to children or grown persons. Affects only rodents.

Read What Users Say

George Umland, Bath, Ill.—“My brother said that he sent for \$1 bottle of virus rat killer and it did good work. It was the best there was so I will try it too and tell all my neighbors of it.”

Mrs. Ruth Blackford, Gifford, Ill.—“My daughter had so many mice at her place and she sent for some rat virus and now she doesn't see a mouse on the farm.”

Elder Quarfot, Faribault, Minn.—“I have spread your Triple Strength Rat Virus as directed, and found that the rats and mice ate all of it. It has been only about a week since I spread it and we do not hear or see them any more.”

Frank Janell, Sioux Falls, S. D.—“Your

Triple Strength Virus is prepared in a scientific laboratory and contains only Virus germs deadly to rodents. The bottle and corks are sterilized and sealed air-tight, so that ALL other germs are excluded. This is why Triple Strength is so deadly. It is tested on rats, mice and gophers before shipment—it cannot fail.

Rats Die Outside

Triple Strength Rat Virus is easy to use. Simple directions show how. A single rat eating the virus gets sick with a contagious plague disease that affects and kills all rats and mice in the immediate vicinity. Rats flee because they become infected with a plague that affects the heart, blood vessels, and lungs, destroying the blood corpuscles and causing suffocation. The rats rush outside where they get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

Triple Strength Virus has sure done wonders for me. We had so many rats that they were destroying our buildings. Two weeks after we put out your Virus we could not see a sign of a rat.”

Fred Zelt, New Haven, Ind.—“I have tried one bottle of your rat virus and found that it does the work all right so I send an order for 12 bottles more.”

Fred Marlott, Sherman, Mich.—“Triple Strength rat killer is real stuff to get rid of rats. I got rid of lots of them. I am no longer bothered with rats. I talked with some of my neighbors about triple strength rat virus. I told them it was clear rat killer and they could get rid of their rats.”

Special Introductory Offer

We want to prove to you our claim that Triple Strength Rat Virus is the most potent, most powerful—yet non-poisonous and absolutely safe—rat virus on the market. It is TRIPLE STRENGTH Virus. Contains more living rat virus germs than any other rat killer made and will go one-third to one-half farther. To introduce this Triple Strength Rat Virus, we will make every reader of this paper—for a short time only—a special offer of a regular \$2.50 bottle for only \$1.00 postpaid. This \$2.50 bottle Triple Strength Rat Virus is enough to clear a poultry house, home or yard of rats and mice.

Money Back Guarantee

Your money back if it fails. Take no chances this year with traps or rat poisons. Triple Strength Rat Virus will positively kill rats, mice and gophers and be absolutely safe and sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question. If not convenient to send money today—just send your name and address, a postal will do—pay postman on arrival. Remember it costs you nothing if it does not do all we claim. GEM PRODUCTS CO., Box 22, Greenville, O.

The back is constructed like the front, only I use a three light, 10x12 cellar sash, and only board it up ten inches high from the floor, then cut in my water sill, same as the front. I then make my opening 10 inches high, and cover it with 12 inch 1-inch wire on the outside. This is to give more light under the dropping boards; and when used as a laying house, these small doors, like the ones in front, can be raised to give more light for the fowls to scratch and prevents them from working all the litter from the front to the rear, where it has to be forked out. These back doors can be left open all spring and summer, and until cold weather, then closed and opened whenever the weather will permit. Again, when the chicks are growing to maturity, they can find a cool shady place in the house on hot days, for with these openings it is cool; and with all the light and air right down on the floor where the fowls live and work the litter will keep dry. Not so with the high boarded front houses.

Under the eaves at the back, I make an opening six inches from the plate. I cover it inside with wire, and hang a door six inches wide and 12 feet long on hinges on the outside, and fasten it down with wooden buttons. This is about one foot above the layers when on the roosts. This door is kept open all the time when the layers occupy the house, excepting in late fall and winter. It makes it nice for them on hot days and nights. I put a door 30 inches wide in the east end of the house, and if no feed house is built on the other end, I place one there also.

Oh, how nicely I can regulate the temperature in this house by the use of these sliding doors and windows. I can make it as warm or as cool as I require for my chicks. The same can be done with the layers at any season of the year. These doors are not in the way, they never sag or warp.

Now at times I use some muslin frames. These I make to fit the door or window spaces, then raise the doors and let them down on the frame. This keeps them in place. I make the frames 18 inches wide. In some of the southern states where I have built several of these houses, I did not make the doors which slide up, out of wood, but made muslin frames which took their places, for in that climate it does not get really cold, and the house can be used as a brooder house by using these frames.

In the interior, I place a 2x4 under the rafter at the end of every 12 foot section, and nail a 2x6 to it at the top to hold the rafters up in the center. These are set 7 feet from the front, and the partitions from the back come out to them. These partitions are built solid every twelve feet, and act as draft preventers along the roosting quarters.

Brooding the Chicks.

When I use the house for a brooder house I make the rest of this partition out of wire, about six feet high, and put a wire door 23 inches wide at the front to pass from room to room.

I make a little door at the bottom of this partition between the room where the stove is and the cool room, for the chicks to pass from room to room.

I never place my stove in the end rooms, as that room is bound to be the coolest. Leave the end room for a feed and cool room, then place a stove in every other room.

I always want to get all my chicks at the same time, so that they will be all the same age. Then if some of them get mixed up from room to room, as they will inevitably, it does not matter much.

I take 30 feet of wire netting, half inch mesh (called Hardware Cloth), 18 inches wide, I nail two laths of the same length as the wire is wide, opposite each other. I nail them on with small 3-penny nails every two feet. This wire will then stand up in a circle of almost any size. I put it around the stove about three feet from the edge of the deflector. This keeps the chicks from getting away from the stove when very young, and keeps them out of any corners, and I make them sleep within this wire circle until they get large enough to roost; but of course I enlarge it, and place it back against the rear wall, this to keep them out of corners and from piling up.

I usually put 500 chicks around one of these coal burning stoves, placed in a room 12x14 feet, and they have a room of the same size to feed and play in when the weather is too bad for them to go out doors; but if you have not had lots of experience with that number about one stove, better not put but 350 and you will have better luck with them and raise better chicks.

I have my rooms warmed up for 24 hours before I put the chicks about the stove; have the heat under the deflector at about 100 degrees, and about 8 inches out from it it will be about 90 degrees. I have my floors covered with cut straw, which is cut to about 2 inches long. This litter is 2 inches deep. I take same roll roofing and cut some feeding pads out of it. These I make about 32 inches

KILL THEM ALL

Every Rat and Mouse easily destroyed by New Discovery
Not a Poison

Absolute freedom from rats and mice is now assured everyone. No more trapping and poisoning just a few. Clean out the whole bunch, old, young, big and little.

Hick's Rat Killer kills every rat or mouse on your place. Most wonderful of all it does not harm anything but rats, mice, gophers, and other rodents. It is harmless to children, pets, poultry and all kinds of stock. It can be spread anywhere and will kill only rats and mice. This death bringing disease rapidly spreads and quickly destroys all the rats and mice. There is no smell or odor for they run outside for water and die away from the building.

A Trial Costs You Nothing

Mr. Hick is offering everyone troubled with these pests the chance to get rid of them at no cost to themselves. He will send three large double strength, one dollar bottles for the price of one. You keep one for yourself; the other two you sell to your neighbors at one dollar each, thus getting your own free and in addition making a dollar profit. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 885, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

PERFECT EGG TESTER, patented, two-in-one, electric or oil lamp; has powerful bull's-eye lens; makes testing easy. Single tester, \$1.50; double tester, \$2.00, postpaid. Circular free. Dealers wanted. C. LINGEMANN, 3110 Elliott Ave., ST. LOUIS, MO.

square. I place these about the stove inside of the circle for the chicks to feed on. They are nice to handle and can be easily cleaned with water and broom.

I first give some coarse sand on these pads, then place my little water containers on them. I never feed, water, or give anything at all, until they are fully 40 hours old. When they are ready for a little feed, I use flake oat meal, and crumble it up for them all I can at the start. I feed them five or six times a day for a few days, but very little at a time. I continue to feed the oat flakes for two or three days, then mix a little fine chick feed with it, gradually cutting out the oat flakes, and substituting steel cut oats, pin head size. I continue to use these feeding pads for about two weeks; then get the chicks to working in a very light litter for their chick feed. Teach them to work early, and keep them at it always.

I use buttermilk for their first drink if I can get it, but if I cannot get it, I use powdered buttermilk. One pound of it will make 1½ gallons of milk as good as the real article, and I continue to give this to them for some time. I have raised as fine chicks on nothing to drink but water as ever had featherers grow on them, and I never allow my water vessels to be empty.

After they get about a week old I commence to give them a little dry mash in small hoppers or trays. I do not let them have it by them all the time. If I did, they would fill themselves with it and water, and would not want to eat the necessary grain feed which they should have. This dry mash is composed of three parts wheat bran, one part corn meal, and one part white middlings, by measurement. I keep chick grit and small granulated charcoal before them all the time. I make some little stands or tables about 12 inches wide and three feet long and 4 inches high, and place their water containers on it, to keep them from scratching litter into the water. "Cleanliness" is the pass word every day and hour with me.

I get the chicks out of doors if the weather will permit just as soon as I can. I take about 20 feet of 18 inch, 1-inch mesh wire, and nail lathes on it, and make a little circle outside the door or outlet for the chicks. I let them into this, it keeps them from running too far away, and they learn to find their way back into the house. I continue this for a few days, then remove the wires and give the chicks the run of the yard.

I do not use permanent fenced-in yards. I take several rolls of 24-inch 1-inch mesh wire, and nail lathes on it. I nail these on every three feet. I make each stretch 75 or 100 feet long. I make 4 yards out of these, each yard being 24 feet wide. I run 100 feet of this across the ends, I drive some little stakes down every six feet and tack the little fence to them. This holds it up. Now when they have eaten up all the green in one yard I pull up these stakes, roll up the little fence, take it to the opposite yard and roll it across, then set it up again, and I have my chicks on new green runs. I then resow the old yard in oats. I can change these little fences in a very short time while the chicks are in the house.

Of course as they get older some of them will fly back and forth. As they are all the same age it does not matter. At night when they go into the house to sleep, if there appears to be too many in one room, I simply drive some of them out to other rooms. At night when they go into the room where the stove is, I run my wire circle about them to keep them from the corners.

When they reach the age that they can do without the fire at night and the weather permits, I take the stoves out of the rooms, remove all my little fences and give them the run of the whole place. But I always feed them in the house, and feed all grain in the litter so as to keep them working, for if a lot of pullets are raised up by eating their grain from the bare ground, they fill themselves with it and go hunt the shade and remain there until the next feeding time, hence they will learn nothing about working. They will be loafers in the laying house, never will make workers. They must be scratchers and workers to be good layers.

After the Chicks are Six Weeks Old.

When my chicks get to be about six weeks old, I quit feeding them dry mash. I only feed it to them when they are small, to keep them busy and prevent any toe picking. I am no dry mash man, however. I think I can prove that I was the originator of the mash feed for poultry 35 years ago, but I never feed it in a dry form, only as I mention above. Always feed it moistened, so when my chicks get to be about six weeks old I commence to feed them a moistened mash at noon, composed of two parts wheat bran, one part corn meal, one part white middlings (by measurement) and 10 per cent fine beef scraps. I moisten this with water which has had dried buttermilk dissolved in it; 1 pound to 1½ gallons of water. I make this mash moist

UNOBSTRUCTED VISION
PATD 1916 LOCK

Dear Sir:

Belmar, N. J., April 19, 1922.

I saw your Unobstructed Vision Remover in use recently and liked it very much. I am anxious to get one and may buy the full set. Please send me your prices, and oblige. Yours respectfully,

W. R. B.

This is the universal verdict wherever U. V. Tools are used. If you knew the financial advantages of caponizing; how simple the operation really is with these improved instruments and directions: how superior "Roast Capon" is to ordinary chicken, you would turn your surplus cockerels into capons this season. Complete set and directions \$5. Remover alone \$3.50. Sent on receipt of price or C. O. D. Satisfaction guaranteed or money refunded. Order today or send 6c in stamps for illustrated literature.

Put Down Cheap Summer Eggs In K. & G. Egg Preservative Now. Have Fresh Eggs To Eat and To Sell All Winter

Don't Sell Your Eggs Now. The price is too low to make you a profit. You can make every cheap summer egg be worth three times as much to you. Cut the high cost of fresh winter eggs. Save every egg now that you possibly can. When eggs are scarce and high next winter, you can get winter prices for summer eggs. Each 50c package of K. & G. Egg Preservative should add \$10.00 to the value of every 25 dozen eggs you preserve. You can never make money faster than that.

K. & G. Egg Preservative Keeps Eggs 100% Perfect

K. & G. Egg Preservative is guaranteed to preserve clean, fresh-laid eggs perfectly for one year. No change whatever takes place. No foul odor, strong or stale taste is imparted to eggs. The eggs can be used for all purposes. The yolks do not break down. The whites will whip perfectly.

The Perfect Egg Preservative

K. & G. Egg Preservative is not liquid glass or any other slimy solution. It comes in powder form; ingredients highly endorsed by U. S. Department of Agriculture. Makes a clear solution, clean, cool, and pleasant to put eggs in or take out. You don't have to use boiled or distilled water. Just take big crock or jar, put in 3 gallons ordinary water, direct from pump or faucet, add one 50c pkg. K. & G. This will preserve 25 dozen eggs. K. & G. is cleanest, most perfect egg preservative in the world.

Order K. & G. Without Delay

No reader of this paper can afford to be without K. & G., for it is the perfect egg preservative. Triple the value of your present egg supply. Preserve them now in K. & G. Egg Preservative. Next fall and winter when eggs are high, you will have plenty to eat and to sell. Big Package, enough to preserve 25 dozen eggs, 50c postpaid. Send your order today for all the K. & G. you want. Free Treatise on Egg Preservation with order.

10,000 AGENTS WANTED

We want to make K. & G. known everywhere. It's the best help to increase profits the poultryman can get. Everyone who raises chickens for eggs, and for profit, needs K. & G. We want an agent in every county in the United States to help us make our product more widely known. Our proposition to agents is very attractive. If interested, be sure to write at once.

enough so that when it is squeezed a little it will adhere together. If it will not, then it is not rich enough in middling, and I add a little more middlings. I never feed a moist mash in a crumbling state. I feed this in long wooden troughs. I give them all they will clean up, for it forces growth as nothing else will.

When they have grown large enough to eat cracked corn, I give them a grain mixture of one part good wheat, one part cracked corn, and one and a half parts good heavy oats. This is fed in a litter in the house mornings and evenings. It takes feed and lots of it to raise good chickens.

Now this moist mash will force growth, and lots of the pullets will want to commence to lay at about four and a half months old. If they do, I cut out feeding the moist mash and put them on a strictly grain ration. I change the grain formula and give them 2 parts cracked corn, 2 parts oats, and one part good wheat. I continue this feed until they are about fully developed. Then I commence to feed them my moist laying mash. Then they commence to do the work of their lives.

I do not want my chicks hatched before the 15th to 20th of April, and none later than that if I want to make winter layers out of them. If hatched in March or early April they will commence to lay some when about four months old if fed and cared for as outlined, but after laying a few eggs will quit and go into a partial molt. They will not produce any more eggs until very late fall or early winter. I would rather they did not lay an egg until the middle of October or the first of November. Then when they commence they will continue through the winter, if properly fed and cared for, for by that time they will be fully developed and can stand nine months of hard labor. That is the reason I do not want anything but the English type of White Leghorns. They have the size and conformation to consume vast quantities of feed to make the eggs I get from them. Transforming the Brooder House to a Laying House.

Before the time they commence to lay, I have installed my dropping boards. I build them three feet, six inches from the floor at the rear of the house. I expect this house to accommodate from 500 to 800 layers. I make my dropping boards four feet wide, for 500 layers, and five feet wide if for 800. I build my roosts 10 inches above the dropping board. The first one from the back will be 12 inches, the rest will be 10 1/2 inches apart. For 500 layers, I put in 4 strings of roosts, and for 800 I put in 5.

I make my nests in 12 foot sections and make the bottoms of 1-inch mesh wire. I place these under the front edge of the dropping boards. They ship in on rests at each end, and can be taken out when ever I wish to do so. The hens enter the nests from the back. I have a six inch door hinged to let down on the front so as to gather the eggs.

Eggs and Nests.

You know a hen always wants to lay in a nest where there is the most eggs. Now if one does not clean the dropping boards every morning, the hens will get upon it and walk about on it, and after she gets her feet daubed up, will conclude it is just about time to lay. So to the nest she will go with filth on her feet, get on a nest full of nice clean eggs, move about trying to get comfortably settled, and by that time there is not a clean egg in the nest. If one is trying to produce quality eggs for his customers, these eggs are not the kind he should produce. Even if they are washed, a washed egg never has the nice appearance that one does that has never been washed.

I always want my eggs to be free from any soiled look, not even a speck. I prevent it. I make a frame the length of the dropping section, cover it with 2 inch wire mesh, hinge it to the rafters directly over the front edge of the dropping board. In the morning when I go to feed them I drive all hens from the roost, let down the frame, so they can not get up there during the day. When I feed them at night I raise this frame for them to go to roost.

In winter I tack same muslin or burlap to this frame and let it down nights, which helps to keep them warm and their combs from freezing.

Another place where they make fifth is at the water containers. I have water pans made of galvanized iron, 12 inches wide, 14 inches long and 4 inches deep. I make a little table 2 feet high, just an inch or two larger than the pan. I enclose this table in on all sides. Directly in the center of the table I make a hole large enough that I can put a lantern down under the pan, hang it by its bale and keep my water from freezing. Make a little frame of laths, set this table against the partition, put this frame of laths over it, letting the frame extend up the partition about an angle of 45 degrees. They drink through these lath openings, but can

not get on the frame or pan with their feet. I make a little perch about 4 inches from the pan for them to stand on to drink. In that way no droppings can get on the table, or water from their wattles drip down on the table, hence they can not get their feet dirty here. All this is inexpensive and does worlds of good.

When my pullets commence to lay, I feed them a grain feed of equal parts by weight of wheat, cracked corn, and good oats; and I will say here for your benefit, you might add forty different other seeds to it and you could not make it a particle better as an egg producer. I have been feeding in this portion for 35 years and know a scratch feed cannot be made better. I allow one quart of this mixture to 20 Leghorns, a day; two-thirds of this I feed to them in the morning; at noon I feed them the other third. This I do to keep them working all I can. I scatter it well in deep litter, being sure to get some of it well under the dropping boards, so as to make them work the litter forward.

About a half hour before sundown, I feed them a moist mash, composed of 2 parts wheat bran, 1 part good corn meal, 1 part white middlings. I am very particular about the quality of the middlings. It must be white and rich. I portion this by measurement. I add $\frac{1}{4}$ measure of alfalfa meal, and 15 per cent meat scraps. A little granulated charcoal three times a week. I mix this up with warm water in the winter season and use cold water in the warm weather. I make it wet enough so that when it is thoroughly mixed it will adhere together, then the fowls will get a mouth full at a time. That is the way they like it. I feed them in long troughs and give them all they can possibly eat and clean up in ten or fifteen minutes. In the winter season, if the weather is extremely cold, and a night promises to be a severe one, after they have eaten up the mash, I give them some whole shelled corn, enough so that each fowl will get 15 or 20 grains. This being a heat producing food, and digesting slowly, it keeps them warm during the cold nights.

The Moist Mash

If one feeds a moist mash at any other time than at night, the fowls will gorge themselves with it, hunt some corner and go to sleep and loaf for hours, but when it is fed at night they can go to sleep and it makes eggs while they do so. Another thing about a moist mash, in the winter season when very cold a hen will not consume as much water as she should; she takes all she wants, but not enough to make eggs; but by feeding wet mash I compel her to take more water. For the mash that 400 hens will eat, it takes 6 gallons of water to mix it. So with my method of feeding and the care I give them and with my design of a laying house, I can get eggs when the other fellow does not.

Now the fine points of my house as a laying house are: If you want to get winter eggs you must keep the fowls comfortable. You can not do that in extremely cold weather with any muslin or open front house. I have had experience with both. With my design of front, I can make it closed and comfortable and still have good pure fresh air in it. Windows front and back give ample light for them to work by, and the light is down low where they want it. Its ventilating opening over the front plate draws up all impure air.

There are too many fresh air cranks in the poultry business for the welfare of the hens, and to get a full egg basket.

I keep my layers in the house all the time, excepting if I can have a nice little piece of green oats or something of that nature, I let them out some evenings about ten minutes, to get a little green eating, just before they go to roost. Some will ask what do you do for green feed for them. I feed alfalfa meal in their mash. That is the best green feed they can possibly have, winter and summer.

When it is not severe cold I open the sliding doors and windows in the front of my house, and in the summer time I keep the back ones open all the time, hence they are like being in a wire coop; and with my openings close to the floor they get good fresh air and the litter keeps dry. This is not the case with houses that are sided up in front some three or four feet as most of them are.

Now supposing I have 800 pullets in this house in the month of March, which have used it as their home all winter, I want to use this house for a brooder house again in April, as it is all equipped for that purpose. Knowing this would be my need, I have constructed another house previous of the same size and design. I now take the pullets and transfer them to the new house, and then clean the older one up, and put in my stoves, and I am ready for 2000 more baby chicks to raise just as I did the first lot. In the second house I build I put no partitions but the half ones, so as to stop drafts along the roosts, for this is to be a permanent laying house. In this house I make my dropping boards fast, while in the first one, I made them so I could

An Event and An Opportunity

Pape's Mammoth S. C. Black Minorca

eggs that hatch, day old chix that live and thrive, partly matured and yearling layers and sires, past and prospective prize winners and a choice lot of foundation pens for quick shipment at greatly reduced prices.

Chix hatched in June, nature's best month, will grow rapidly, they will be beautiful in form and feather, prize winning qualities and production of glorious large white eggs dependable. Customer reports hen produced 211 eggs in 223 days, another 284, 289, 291 and 300 eggs each in 325 day without artificial light and force feeding. Our illustrated catalog is free—state requirements please.

Charles G. Pape Box B 74
Fort Wayne, Indiana, U. S. A.

From 10,000 to 80,000 Egg-Capacity in three years

Read this interesting story of the amazing growth of Mrs. Steinhoff's hatchery.

In 1919, Mrs. Edward Steinhoff of Leon, Kansas, bought four of our No. 6 Buckeye Mammoth Incubators, with a capacity of 2,440 eggs each.

A year later she came all the way to Springfield, Ohio, to see a demonstration of our 10,368-Egg Buckeye No. 7. So impressed was she with the results that she purchased one of these incubators before leaving Springfield.

In 1921 she purchased four more 10,368-Egg Buckeyes and in 1922 added three more. Her bank, recognizing the soundness of her

business and the merit of her incubators, has been glad to help her in financing her increasing Buckeye equipment which has now been entirely paid for out of the profits of her business.

The illustration shows only four of her eight Buckeye Mammoths and the highly profitable hatch which she and her son are preparing to ship.

She is a typical Buckeye success, starting in a modest way and growing up to *real* business proportions.

Buckeye *mammoth* *incubators*

Buckeye mammoth incubators

Among the 800 Successful Hatcheries Using Buckeye Mammoth Incubators are many whose growth is just as remarkable, with capacities up to 200,000 and more.

Buckeye Mammoth Incubators are making more money for users than they ever made before—through consistent performance, bringing forth the highest percentage of strong, vigorous chicks

Ask the Buckeye User—He Knows

The Buckeye user *knows* in advance, to within one to five per cent, just what his hatch will be. He *knows* precisely how he is going to take care of his customers' demands for chicks and he builds up a loyal patronage. And he *knows* that with Buckeye vitality he will not lose more than one-half of one per cent of chicks in shipping. Successful Buckeye Mammoth owners in widely different temperatures and atmospheric conditions from coast to coast in the United States and Canada are *proving* every week that the Buckeye Mammoth is the *real business incubator*.

The Buckeye Mammoth requires only about one-fourth the room;

saves half your time and labor; reduces both installation and operation cost. The 108 turning trays, each with a capacity of 96 eggs, are all turned in less than five minutes. As a matter of fact, the Buckeye Mammoth Incubator literally *takes the uncertainty out* of the commercial hatchery business and puts it on a scientific business basis.

We will be glad to send our Buckeye Mammoth Catalog which tells all about this remarkable invention. Let us show you how to start small and grow big in the commercial hatchery business.

THE BUCKEYE INCUBATOR COMPANY
811 Euclid Avenue, Springfield, Ohio

World's Largest Manufacturers of Incubators and Brooders

Buckeye Mammoth Incubator No. 7

Capacity—10,368 eggs held in 108 turning trays. This capacity does not include the 36 hatching trays. All trays equipped with convenient card holders which make record keeping easy.

Size—Eight feet six inches square; height, seven feet three inches.

Weight—6,800 pounds, crated.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½-inch cast iron pipe.

Electric Fans—Four ball-bearing fans, specially constructed for incubator service.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two certified thermometers, specially constructed for Buckeye Mammoth Incubators.

Thermostat—Specially constructed to provide the highest efficiency in temperature control. Solid brass hardware used on Buckeye Incubators exclusively.

Buckeye Mammoth Incubator No. 8

Capacity—4,600 eggs. 48 turning trays with a capacity of 96 eggs each and 16 additional hatching trays. All trays equipped with convenient card holders which make record keeping easy.

Size—Five by eight feet; height, five and a half feet.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½-inch cast iron pipe.

Electric Fans—Two ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers and Thermostat—As in No. 7.

Buckeye Mammoth Incubator No. 6

Capacity—2,440 eggs. Twenty egg trays, with a capacity of 122 eggs each. One extra tray for egg turning.

Size—Five feet square, 32 inches deep. Legs eighteen inches high.

Weight—850 pounds, crated.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1-inch cast iron pipe.

Electric Fans—Two 9-inch ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two specially constructed thermometers.

Feed for Quick Growth

Save Feed—Prevent Lice and Mites

This is the time of the year every poultry raiser should look ahead to plan for big profits for next fall and winter. It is the early fall and winter

eggs that make best poultry profits. A little time taken now to apply tested methods means many dollars later. Best methods should be used to feed for quick growth and save feed. Even at the present low grain prices, feeds should not be wasted. Don't lose money experimenting. Take advantage of what others have proven by years of costly effort. Every poultry raiser should read "Dollars and Sense in the Poultry Business" by Prof. T. E. Quisenberry, one of America's foremost poultry authorities. This new 96-page book will be sent free to any reader of this paper. This free book outlines methods:

How to prevent lice and mites.

How to develop chicks to early layers.

How to grow chicks quickly and save feed.

How to treat chick diseases.

And hundreds of other useful poultry secrets and methods.

Write today. A post card will bring you this valuable free book at once. Just send your name and address to the American Poultry School, Dept. 2067, Kansas City, Missouri.—Advertisement.

Shoemaker's Poultry Book and Almanac for 1922

Send for it NOW!

The book has about 200 pages, with many colored plates of fowls, true to life. Tells all about chickens, their cost, their care, and diseases and remedies.

The Globe

It also tells all about incubators, their prices and operation. All about poultry houses and how to build them. It's an encyclopedia of chickdom. You need it. Only 20 cents. Your money back if not satisfied.

take them out, as they would be in the way when I would use that house for a brooding house.

Culling.

In the fall I cull out about two-thirds of the layers in the second house and dispose of them; then cull out all the pullets that are not of a promising appearance, which will be about one-third of them. Thus I have two-thirds pullets and one-third hens for my winter laying. Every fall I repeat this process; also sell off all those that have passed through two laying seasons. So you see by following this plan I am always sure of winter eggs, and can handle from 800 to 1500 head of stock. And all the money I have invested in buildings is these two houses. No colony houses to fool with or any special brooding house, to be going to rack for nine months of the year. Can you beat it?

If I can get a piece of ground 212 feet long so I can get my house on the ground the whole length, I can build a feed room in the center, have a house extending both ways from it, hence can work both ways from the feed house, never have to go out in any storms and have everything I want handy to use.

Just think of having six or eight colony houses scattered about over eight or ten acres, and have chicks in them and weather storming! What a nice job a man has on his hands! Again, supposing I had a lot of chicks in such houses, supposing a 12x12; its a cold, dismal day; one fires up his stove in the morning and goes to other work; the wind comes up and makes the stove burn more rapidly; it gets hot in there, almost red hot, the chicks can not get away from it and have to endure it until the fire burns down or you make another visit to the colony coop. What are the results? The chicks are roasted, simply dried up. In my design of a house, it is close to the residence usually, and if one has 2000 chicks in it he is about them all the time and knows what is going on. I visit my chicks in the house every night before I go to bed, to see if everything is just as I want it to be. No going to bed like some and guess everything is lovely.

There are lots of people who term themselves poultrymen, who never owned a hundred chickens in their lives, who will find fault with my design of house, and my methods of rearing chicks and caring for the layers. Let that be as it may. I am not writing this for that class of men, but if one of these doubting Thomases will come over here in Pennsylvania where I have constructed this last house, and see for himself, I think he would change his mind.

Now I have told you how I accomplish success in the business. I may build you one of the most perfect buildings and equip it for all needs of the chicks or the layers, but that is no sign that you will succeed with it after I turn it over to you.

There is no business known that a man can take a pencil and a piece of paper and figure himself rich in so short a course of time, but when he comes to do it by actual experience he finds he did not figure right.

The business is made up of a lot of little things, and they all dovetail together. Its a 365 day job, and you must be on the job all the time. If you are employed by some one by the day or month, you are expected to put in all that time in order to get your pay, and when you come to work for yourself, do not loaf half of the time and expect the hens to keep you the other half. They will not do it. You must be systematic in all you do. Do your feeding at regular hours and not vary. Feed plenty. Half of the fowls on egg farms are only half fed. Same with the growing pullets. That is the reason half of them are culls. It does not pay to be too saving with the feed. Give all they will eat at their regular feeding time, and have none left over, so that they will meet you at the gate when the next meal hour arrives; but make them work for all the grain you give them.

Do not think that because you have raised 50, 100 or 200 chickens in some inconvenient place, that you could do as well with 2000, for when one comes to get 2000 or more together it is a different proposition. Some poultrymen who are well versed in the business do not have as good success one season as another, and still may work the same way he did the season previous. One thing, they are not the same chickens as those he raised the last season; perhaps from different parents; or the season is not the same; but there is a difference.

I have had many visitors come to the poultry farms where I have been located, and upon going through the yards see several thousand fine young chickens, ask: "Oh, how do you do it?" I simply say, I can not tell you, I can tell you tonight what I have done today, but I can not tell you what I will have to do tomorrow. It takes good common sense to be a poultryman and raise them by thousands a year.

RADFORD BARRED PLYMOUTH ROCKS

Radford Barred Rocks are the birds that satisfy back lotter, farmer and poultryman alike because they are fine to look at, vigorous, early maturing layers and meat producers. Radford Farms stupendous win of ten out of twelve firsts competed for at Milwaukee National November, 1921, proves their wonderful exhibition quality.

Big Catalog FREE

Tells all you want to know about Barred Rocks—history, mating, etc. It also gives full information about Radford Farms—their winnings—their eggs for hatching—100% fertility guarantee—their baby chicks. All handsomely illustrated. Write for your catalog today.

(Continued from page 670)

margin of profits often to the vanishing and even minus points.

On the other hand, we all know or have heard of the man keeping a flock of purebred chickens, who owns a good cow or so, a horse to help him in his farm work, some bees, a nice orchard, and even some pigs, who never experiences the pinch of the specialist, no matter how adverse conditions may be for some of his products. We must never lose sight of the fact that the poultry specialist is compelled to feed his poultry whether it is producing or not. He must purchase all of his grains, milk and mashes, causing a heavy and continual cash outlay. He cannot sell his stock to advantage at just any old time of year. He must wait for the proper seasons for this, or he lowers his chances for profits. Now the man on the little diversified farm finds that his cow may supply much valuable food for the fowls, his few pigs may be slaughtered and sold to advantage at almost any time, and so his cash outgo lessened and his income increased in the lean months.

We know that after July first and well into October the egg production on most poultry farms is pretty low. If other products can be sold during this period, the dangers of specialization are minimized. A family possessing a good cow, some pigs, and a prolific garden never experience the pinch which we find so often occurring to those who have staked everything they own on one crop. The farmer, no matter how little money he may take in in the course of a year, can usually feed his family substantially, even if they cannot live in any degree of style.

The ins and outs of keeping chickens take time to master. In the meantime, we must live, and cheaply too, so that our enterprise may prosper. The salvation of many a man of small means hoping to develop into the owner of an expensive poultry farm would seem to lie along these diversified lines, then.

Mr. Frank C. Sargent, recognized as one of the outstanding agricultural figures in Australia, has this to say, among other things, regarding this most important and interesting subject:

"Poultry keeping is, as we all know, extremely profitable on paper, but in actual practice it does not always work out so profitably. There are so many causes that interfere with the health and egg yield of fowls that a man is very fortunate who, depending solely upon poultry, achieves the profits that he anticipates. Personally I have seen hundreds start out as poultry farmers the last two or three years, then go out to be everlasting 'knockers' on the industry.

"The reason is largely a too great dependence upon the hens alone. All the capital available has been sunk in the venture, and sometimes goes wrong—no income is coming in, but there are big feed bills for the fowls, and the ordinary household expenditures to be met. Had the same capital and energy been put into a mixed farm, a very different tale might have been told. The greatest weakness of a straight poultry keeping venture is the fact that the poultry must be fed whether producing or not, and so must the poultry keeper.

"On a mixed farm the cows and pigs can largely be fed on pasture or grown crops, so that if, instead of devoting all his capital to poultry, our suppositious farmer had invested in one or more cows and a couple of breeding sows, he would have less poultry to feed, and in the event of some cause sending the birds off the lay, less feed to pay for, and also you will concede, that with a lesser number there would be less likelihood of those untoward happenings that are the bane of the poultry-keeper's life.

"A mixed farm presupposes a certain amount of cultivation, and with the poultry and other animal manure, good crops of fodder for the cows and pigs can be grown at only a nominal expense.

"A cow, or cows, means ample milk, cream and butter, and where there is any cultivation at all it is easy to grow a plentiful supply of vegetables; these are two factors which greatly minimize the household expenses—a fact, at a pinch, a man with a few fowls, a cow, and a vegetable garden can live without any cash income at all. A good sow or two, giving two litters a year, and mainly fed on crops grown on the place, will add materially to the income.

"We see, therefore, that in the case of the small mixed farm, adversity cannot put a man down and out so quickly as he can be put out by investing his all in a 'straight' poultry enterprise. The risks are not so great and, I venture to say, that the work is not any more arduous, and is a great deal more interesting.

"High class soil is not necessary to mixed farming, as the very nature of the operations is such as will make the poorest soil rich in very quick time. The one thing to guard

Prices of strong, purebred baby chix for June and July. Barred and White Rox, R. C. and S. C. Rhode Island Reds, Buff Orpingtons and White Wyandottes \$12 per hundred; \$6.50 for 50; \$3.50 for 25. against is sour, undrained soil, but given good drainage, all other things are possible.

"The food produced on the farm represents a big figure in the family expenditure, and clothing need not be a big item. Also the farmer is free from many other expenditures, such as fares, etc., that the city worker finds necessary. In such circumstances the cash income need not be very large in order to place the farmer in a much better position than the city worker."

These very pertinent words indicate clearly how strongly such a man as Mr. Sargent feels about poultry keeping as a specialized business. And we are noting that agricultural colleges are advocating this sort of mixed farming increasingly as time goes on. We clearly see, therefore, that a man with a limited amount of ready capital may engage in the keeping of chickens in connection with other farm activities, provide a comfortable home for his loved ones, providing he is willing to put labor and thought into the undertaking. The help children may be trained to give can be of considerable importance. And I have the child-labor laws well in mind when I say that. Most healthy, normal boys and girls are eager to help when the matter is placed upon an attractive, profit-sharing basis. The steps little sturdy legs can save are many, and the tasks, they may do for us quite as well as we, are numerous, if we encourage and show them how they may help and serve.

Some of my readers may think that this would all entail a large farm enterprise. This I do not believe necessary nor essential. A ten acre tract well planned and cultivated will serve splendidly. Many a would-be poultry specialist would have done far better had he split his outgo and energies and secured for himself a more diversified farm. I give below a few ideas on this subject, which may be modified to suit individual needs and conditions. It would hardly be feasible to use all of the sources of income listed, but enough of them may be incorporated to insure a living income until the poultry department can be developed into an extensive enterprise, if this is desired.

Let us use a ten acre tract as our basis of computation, supposing that the land is of fair richness, well watered and drained, and capable of growing and maintaining crops and live stock such as we ordinarily find on the diversified farm. Its exact location may be left to individual needs. This land may safely carry:

1. Five hundred purebred, well-housed fowls of any of the Standard varieties. By devoting three acres for range for the mature fowls and growing chicks we still have seven good acres left. The quality of this stock may be such as to insure extra good breeding prices, as well as a premium for the table eggs of the finest quality. Quality and not quantity is our slogan on this highly diversified, interesting poultry farm.

2. An apple and peach orchard; either or both. These fruits are always in demand, and if the trees are properly pruned and sprayed each year, we are sure of a good many barrels, providing a killing frost has not dimmed our chances. This orchard may be incorporated with the poultry, as we all know, so that two or three acres devoted to this purpose may not require more than one additional acre plus the three already laid out for poultry purposes.

3. Some bees will help swell the family income, supply delicious sweets for the table, and prove beneficial to trees and flowers. There is always a demand for pure honey, and if you are located on a motor road, all may be sold at fancy prices. Very little space is required.

4. A good cow. Her value as a producer of the finest human food is too well known to need any comments here. The glow of health that milk puts on little cheeks, the economy it represents in the daily menu, are things of common knowledge. The butter that may be made; the buttermilk, skimmilk that may be used for poultry purposes have been emphasized many times. And also the value of the calf, if it be sold, will prove welcome. An acre of good pasture will prove sufficient for needs, supplemented with various other foods.

5. A good horse will cultivate this ten acre tract easily, and at times most convenient to the owner and to the best interests of the land. When poultry runs need freshening, and the winter cover crop needs attention, the faithful horse proves his value, as he does in countless other ways. The horse may graze wherever convenient and need not require much land for his own purposes.

6. Some pigs are always a source of income and food for the family. They can be fed from the refuse from the table, from the products of the cow, and in turn will aid materially to the family purse. The space required for them is small, and in the fall they may be permitted to graze and by their process of cultivation help orchards materially in keeping well turned over.

Get Quick Growth —Save Feed

Now is the time to develop your chicks to early layers and for market. To know how to feed for quick growth and still save feed is told in a new 96-page book, "Dollars and Sense in the Poultry Business," written by T. E. Quisenberry, one of America's greatest poultrymen. This book also outlines fully how to market for top prices; how to prevent loss from diseases; and hundreds of other poultry secrets and methods, gained from over 30 years' experience as a practical poultryman. A copy of this helpful book will be sent absolutely free to anyone who writes The American Poultry School, Dept. 2068, Kansas City, Mo.—Advertisement.

None Better! Quality Eggs, Chicks and Stock in Season. Catalog free upon request. Write today! C. W. Hockings, Box A, Burlington, Wisconsin

7. A large garden well planned so that the rotation of vegetables comes at the proper seasons will be of great help, both for family consumption purposes and for selling to customers. A small stand in front of the farm with an attractive display of fresh vegetables will not long go begging for trade. An acre well cultivated will raise a surprising amount of vegetables, which can either be used fresh, canned, or dried for winter purposes or sold.

8. Some choice berry bushes are a welcome addition to the family larder, and with the high prices berries bring today they can also be a help towards rounding out the yearly cash income.

It would be hard indeed to get "caught short" with such a diversity of income, no matter how badly any one or two branches of this little world of production may be hit at various times.

If the reader desires in time to specialize more along poultry lines, he will have gained his experience without taking too great a risk during the learning process. Many a time the family cow and a well-tended garden have spelled the difference between failure and final success. What if the clothes he plain for a few years? A well-nourished body can stand many hard knocks, clothed as it may be in overalls or gingham. With high hopes, a vision for a real poultry farm, the hard working man and woman may look forward to the future with high courage and the assurance that sooner or later their efforts will be well rewarded. And mainly because they have based their enterprise upon sound financial fundamentals. They have gone far towards making themselves self-supporting at small outlay, and are therefore the better able to wait until their lessons in poultry keeping are well learned.

Any of my readers who are seriously contemplating going into the poultry business will do well to stop and consider these few ideas. A rich man can try anything, but it takes a man of moderate means with horse sense, persistence, and the right foundation to make a success in life which really amounts to something.

(This article is along sound lines. Mr. Forster is right when he says that the one crop farmer is always in the most precarious position. The exclusive cotton farmer, the exclusive corn grower, the exclusive apple grower, the exclusive poultryman, are always dependent on a single source of income. There is one suggestion of Mr. Forster's that we would elaborate on, and that is, the amount of land required. This is a debatable question, we know, but having spent some years on both an 80 acre and 12 acre place, we would suggest that a small farm of 40 acres is about what a man in sound health, with a little family, should have. Even if all the land is not suitable for cropping, it will afford more pasture. —F. L. P.)

Our Cover.

The massive, well feathered birds on our front cover this month are Buff Cochins. The early Cochin was not covered with such long, profuse feathering. The full-feathered bird is the development of British fanciers, imported to America in the nineties. It is the accepted Standard for the breed, and hard, close fitting plumage is to-day a very serious defect. American breeders also insist on soft leg feathering, and stiff hock feathering allowed in England, is a disqualification in U. S.

Cochin breeders will find much to admire in the cock shown on our cover. There has been a tendency among American breeders to prefer too affeminate a type of Cochin male, and the strong, sturdy, prolific cock is not as much in evidence as he should be. After seeing Geo. Proctor's birds at an out-door exhibition at the Crystal Palace, London, 1911, we were impressed that the best English breeder laid stress on males not weak in masculinity.

The well rounded form displayed by the birds on our cover represent the ideal of Cochin breeders. This pair won 1st as cock and 1st as hen at the Boston show, Jan. 1922.

There is a revival of interest in Cochins in New England. Some White and Black Cochins of outstanding quality were also shown at Boston.

The tipping forward carriage of the Cochin hen is typical of the best birds. The long feathers with a great amount of under fluff in each feather lends a fullness to the outlines of these birds that makes them appear very massive. The standard weights for Cochins are: cock, 11 lbs., cockerel, 9 lbs.; hen, 8½ lbs.; pullet, 7 lbs. The birds look even larger. The hens lay brown shelled eggs and are splendid sitters and mothers.

A Card of Thanks

WE THANK our friends for their patronage this season—the largest in our history. Even with our increased capacity, we have had to turn down thousands and thousands of dollars' worth of orders for chicks and hatching eggs this spring.

HUNDREDS OF THOUSANDS of baby chicks, stock, and hatching eggs have gone to many states and foreign countries, with scarcely a complaint.

WE BELIEVE our patrons have received a full dollar's worth for every dollar they have sent **LORD FARMS**. We believe no other farm in America can beat us on the livability of the chicks it sends out. We believe no other farm in America ships chicks which when grown, will average more eggs in twelve months than will

LORD FARMS LEGHORNS

EACH YEAR our business grows larger, because we are building on the sure foundation of satisfied customers who come back for more, and who recommend our strain to their neighbors.

WE THANK YOU.

LORD FARMS

61 Forest St., Methuen, Mass.

JAMES H. LORD, Prop.

P. S.—We can still accept a few more orders for June chicks at our low June prices. If you want quality chicks write us at once. 80 page illustrated catalog on request.

Green Sheen Strain Silver Campines

Last Call for Hatching Eggs

The natural breeding season is here. Campines that are hatched in May and early June will make the finest show birds and winter layers. Remember the Campine grows faster than the Leghorn.

\$7.50 per sitting; which is 25% discount. Three sittings, \$20.00

Instead of waiting until June to cut prices, as has been the usual custom among breeders for many years, I am giving you a 25% discount this month, in the heart of the hatching season. My pens contain all of my great Chicago Coliseum winners, and you will receive excellent value for the money you send me.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some good cockerels at \$5.00 each.

Order direct from this ad and save time—satisfaction guaranteed.

MAPLESIDE POULTRY FARM, Box F, LINCOLN, ILL.

The Pekin Duck as a Profitable Market Fowl.

(Continued from page 668)

cinders close to the feed troughs in each yard, and it is surprising the number of trips the ducks will make to these grit boxes while feeding.

Ducks and chickens should not be allowed to feed together. If chickens are allowed to feed with them they, as a rule, get most of the feed. Ducks are very timid, and when the chickens rush in they get frightened and leave.

Plenty of clean water to drink, but none to swim in.

There is no domestic fowl that will take on fat more rapidly than a duck, when properly fed and cared for, but they must not be crowded into small, damp coops. They should be kept in good sized yards with dry, well ventilated houses to stay in at night. They need exercise and fresh air.

Feed ducks morning, noon and night, all they will eat in from fifteen to twenty-five minutes, of the following mixture: Equal parts cornmeal, middlings and bran moistened with buttermilk. Mix well, adding a little salt and some powdered charcoal once a day. Then to the above mixture should be added about one-third its bulk of cooked vegetables, such as small potatoes, pumpkins, beets or turnips and boiled oats. If you do not have ground with plenty of green grass, a good food can be quickly grown by sowing rape broadcast. Ducks relish cabbage, lettuce, or swiss chard. By all means make some provision for their requirements along this line.

Do not allow the young ducks water to swim in, as they will not grow as rapidly nor fatten as quickly, and their meat will not be as tender. Always keep fresh water before them at feeding time so as to allow them to dip there heads in it to wash their bills. When preparing for market, it is well to keep the ducks yarded—do not let them have a large range to roam over.

To keep ducklings from wandering, use movable fences made of 12 inch boards with stakes driven on either side to keep them in place. These should be changed once a week to fresh grassy ground.

Ducks must also have shade in the warm summer months. If you have no shade trees, drive posts to project about 2 feet above the ground and nail poles or slats horizontally on top, covering them with boards, canvas or anything that will keep off the scorching midday sun.

Mating the Breeding Ducks.

To those who start with breeding ducks, it is best to mate up the pens about January 15th, one male to six females. Two weeks after mating, the eggs may be saved for hatching. Laying ducks are very susceptible to changes in feed or quarters. Moving the ducks from one house to another, changing their rations, unusual disturbances or the presence of strangers in the house will invariably cut down the egg yield.

Clean straw should be provided for the ducks to lay their eggs on, and then the eggs will need very little washing. Should they become soiled it will do no harm to wash them before placing in incubator or under hens.

The question of egg production in the duck family depends to a great extent on the man and his methods of feeding. Under ordinary conditions the Pekin Duck will commence laying about the middle of February. The laying season continues from then until July. Several well known breeders estimate that 100 eggs is a good production for a bird. Water to swim in is not absolutely necessary for breeding ducks, but the eggs will be more fertile and will hatch into stronger ducklings if there is access to a small pond, pool or stream. Free range ducks should be shut up each night and not released in the morning until they have laid; otherwise the eggs may be dropped about the farm or into the water and lost.

Feathers.

The feathers picked from Pekin Ducks, during the molting season, are of the highest class; being pure white and downy, they command the highest market price. This item brings in quite a sum of money where ducks are raised in large numbers.

It is an old saying that "A Pekin duck hatched is a duck raised" and with proper care the first two weeks this rule will hold good. No domestic fowl will respond to good care more quickly than a half grown Pekin Duck. Plenty of feed, given at proper intervals, will fatten a Pekin duck or duckling for market in fifteen days. Where can you find a market fowl that will weigh 4½ lbs. to 5 lbs. at ten weeks of age?

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself. J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right. OSCAR THOMPSON, Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now. JOHN HOLTRAP, Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective. HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter. FRED S. WILLIS, Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers. EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried. MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me. J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed. MRS. L. M. JOHNSON, Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles. BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about. L. G. STAYNOS, Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

Facts and Fancies About Standard Making.

(Continued from page 671)

Here they are for your consideration:

First, the Standard calls for the same solid black stripe in the Partridge male as in the Dark Brown Leghorn male. Now, the Brown Leghorn breeder has lumps of metallic black pigment in his cockerel-bred females to produce that stripe. You Partridge breeders have only narrow black penciling in your females, and in your best exhibition females, that penciling is practically free from metallic. It is harder for you to produce the solid black stripe than for the Brown Leghorn men to produce it. Moreover, you know that your best males for producing penciling have a red quill in their hackle and saddle feathers. Do you want to retain the solid black stripe of the Brown Leghorn, or do you want your so-called "penciled stripe" to be Standard for your Partridge males?

Second, the Standard calls for an even colored bird. The color of many of your best breeding males is slightly accentuated over the wing bows and back. Those who have examined the Partridge Cochin males of Geo. W. Mitchell, know that the red is deeper on the wing bows and back. On this point, Mr. Mitchell has remarked to us: "If you want to breed by Standard mating, and I take it that should be the aim of all breeders, your females will come smoky if your male is as dark in hackle and saddle as in wing bows and back, and if the wing bows and back of the male are as light in color as his hackle and saddle, the pullets he sires will be too light. What we should have is a happy blending of color rather than a continuation of color."

The Partridge Standard that is adopted at Knoxville will continue in force and effect from 1923 to 1931, inclusive. Now is the time to lay the foundation for greater popularity of the Partridge varieties, during those intervening years. You have all that the Rhode Island Red men have, with your wonderful black striping and black penciling laid on top of the red ground color. The only draw back is, many beginners, who are the life of all varieties, say: "But, the trouble with the Partridge is that it must be hard to breed." Do you want to simplify the problem by not insisting on a solid black stripe and a continuation of color in the male? The Standard Committee understands that pronounced systems of double mating lead to agitation for double Standards. They will hear your requests with respectful ear.

The Dark Brahma men have asked for a mottled breast. It may seem like a long call from the Dark Brahma aisle to where the Partridge Rocks and Wyandottes are cooped. But what ever changes of color makings go into the Dark Brahma Standard, the same will go into the Silver Penciled Rock and Wyandotte Standards. And the Partridges are their counterparts—in reality Golden Penciled Rocks and Wyandottes. All of these silver penciled and Partridge varieties have the same color type. The Dark Brahma men want to simplify the breeding problem; and they are not without influence. Do you want a mottled breast on your Partridge?

The Standard Committee has given the Partridge Rock a moderately broad feather in neck and back. That means a rather broad black stripe. Such a stripe will carry a red quill without disfiguring the beauty of the male. Such a feather was carried by the wonderful Partridge Cochin cock of Geo. W. Mitchell that was smothered enroute to Boston show.

The breeders of Partridges may not want to adopt either of these suggestions. The Standard Committee reasoned that they would not. But, we present them with some force of argument to bring the matter to your attention, so that you may thrash it out in your own minds. It is desirable to think of these things in advance, so the Standard may be a finished product, not a hastily compiled text in which deliberate and mature judgment did not have time to function.

One successful breeder of Partridge Wyandottes writes:

"I had hoped the committee would have made white in any section of top color a disqualification and white in undercolor no serious defect. I hope it will make the even shade of red in Partridge males over wing bows, saddle, hackle and back very important, for if a level shade over the four sections the bird is of better quality. No male will win with orange in two sections (the other two cannot be made orange) nor with dark red in hackle and saddle (for then the wing and back will be maroon). If the four sections are demanded even in shade, then the males will be shown uniform and the same kind will win all the shows—if the judges please.

"But the word 'bay' in the female description was the happiest change. We rave about the bright makes and put the dark one

out of the shows only to be kept, openly or in secret, in the breeding pens to produce the "mahogany" or "reddish-brown" females. I would like to see it straight bay before many more Standards are made; then the Partridge color will win the world."

In regard to the undercolor of Partridges, that is to be "slate" as in Black Leghorns. An interpretation of slate is given under that head in this article.

The White Orpington Faction.

J. I. Lyle, Secretary of the American White Orpington Club, has addressed the following communication to the three hundred members of that club:

"The A. P. A. fails again. Notwithstanding that the constitution of the A. P. A. provides that the Standard of Perfection should be made by the specialty clubs, the Standard Committee, without a single Orpington breeder included in its membership, attempted to dictate to the Orpington breeders the Standard for the breed.

"This Club has been working on a new Standard for over two years in our endeavor to get something that would be understood by the amateur and properly interpreted, with some degree of uniformity, by the judges. In addition there were certain fundamental things in the type of the Orpington that all of us breeders wanted.

"I haven't before me at this time, the Standard which the committee will recommend to the Knoxville convention, but, from information which I have, I understand that many changes have been made and much cut out from the recommendations made by this Club and breeders of other varieties of Orpingtons. For instance:—All Orpington breeders are of a unit that they want the body of the Orpington to have a slightly forward tilt. I have information that the Revision Committee has seen fit to cut this out. We recommended for the back 'breadth over base of tail nearly as great as between wings at shoulders.' The Revision Committee, we understand has also seen fit to cut this out, and leave it in the old indefinite way, i. e., that the breadth should be carried well back to the base of the tail.

"I want to ask, in all sincerity, who is the Standard Revision Committee, that has any right under the Constitution, to change the Standard proposed by the specialty clubs? Speaking for myself, and I believe that I can speak for the other Orpington breeders, we do not intend to submit to any such action on the part of that committee. We are going to fight this thing out at the Knoxville convention, and, if necessary, publish our own Standard and tell the A. P. A. to go chase themselves. There are enough shows that will have our standard for their judging, to give us all the exhibition we need, if we have to come to that. We believe that the breeders of any variety are the ones to determine how they want the variety developed and we do not believe that there is any reason for our submitting to changes by men who know little or nothing about our breed or variety."

It is realized that the specialty clubs must be satisfied, and the Knoxville convention will satisfy them, for the Plymouth Rock, Wyandotte and Leghorn breeders will assume that the Orpington men best know what they should have, and will vote with them. The Orpington men will return the compliment when Rock, Wyandotte and Leghorn questions are up for decision. It is rather premature, therefore, to say to the A. P. A., "You failed again." The A. P. A. as a body, hasn't yet had the chance to fail.

Mr. Lyle, "big chief of the Orpington clan, says that he will be on hand at Knoxville to take up the cudgel, like a crusader battling for the right. That is fine. It looks like a big attendance at the August meeting at Knoxville, and that is much to be desired. If all the discussion and warfare of ideas leads to a big convention, it will have been worth the white paper and printers' ink that it has consumed.

In the making of a Standard, there is of necessity much arguing, much writing, many opinions; and opinions held by all good breeders should be fully expounded that the new Standard may embrace between its covers the best knowledge of the best minds in the purebred industry.

We regret, however, the suggestion of the Secretary of the White Orpington Club that in case the A. P. A. should fail to accept the club's Standard in total, the club will issue its own code for breeders and judges.

The A. P. A. with all its faults and weaknesses, is, after all, the constituted authority in the purebred poultry business. For half a century it has made Standard law. Unfortunately, all over the world, there is a growing disrespect for constituted authority and law. However, no man should be so high that he is above the law, even though he may regard the rule or regulation as a personal affront. No officer entrusted with applying the law should set that law at defiance.

When Dirt and Disease Sneak In

profits fly away. Disease usually starts in unclean living-quarters, and in such quarters lice and mites always are more plentiful. From now until October lice and mites breed most rapidly—it's the time when clean living-quarters for your stock needs strict attention.

CARBOLA

The Disinfecting White Paint

makes the job of whitewashing and disinfecting a matter of one operation—turns a mean job into easy, rainy-day work. It increases the light more than whitewash, and helps put buildings in that clean, sweet-smelling, sanitary condition so necessary to keep animals free from the losses and troubles caused by lice, mites and the contagious diseases that affect poultry and livestock.

Use it Instead of Whitewash and Disinfectants

Carbola comes in powder form with the disinfectant already combined. It is ready to use as soon as mixed with water and can be applied either with brush or spray-pump to wood, brick, stone, cement, plasterboard, or over whitewash. Carbola doesn't blister, flake or peel off nor clog the sprayer, and it dries out white. Carbola doesn't spoil—can be kept in powder form or mixed and kept standing in pail. One gallon covers 200 square feet.

And don't forget that the dry powder is unexcelled as a louse powder and costs much less than most other brands. Use it on poultry, cattle, horses, hogs, etc., as any other louse powder is used. Carbola is harmless to the smallest chick or to stock that licks a painted surface.

Your hardware, seed, drug or paint dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express.

SALE OF BREEDERS AT REDUCED PRICES—Can supply single birds or full strings to win in any competition desired. A number of extra fine utility pullets from egg-record stock. Write for catalog.—EDGEHILL FARM, Box A, SCOTCH PLAINS, N. J.

A 2-month-old cockerel a few hours after being attacked by head and neck lice. Both baby chicks and grown fowls are killed in great numbers by this type of louse.

Mineralized Water Routs Chicken Lice

A new scientific discovery makes it easy to rid poultry of lice and mites. Simply dissolve in the fowls' drinking water the harmless mineral tablets known as Paratabs. Soon after the fowls drink the mineralized water, all lice and mites leave them. Chicks that drink the water never will be troubled by vermin.

The body louse of chickens

Paratabs do away with the bother of greasing, dusting, spraying and other unsuccessful methods of fighting lice. They are warranted to impart no odor to flesh or eggs. They cost only a trifle and are sold under a money-back guarantee. Thousands of poultry raisers are using them with complete success.

The head and neck louse of chickens

What Users Say

Paratabs are the best thing for chickens I ever used. They clean the hens and make them lay, and I don't find any lice, mites or fleas on any of my young chicks. Paratabs are a good tonic for all chickens.—MRS. W. A. G., Jacksonville, Fla.

Paratabs are fine. My chickens have no more lice. Before using Paratabs I had 20 loaders on the roosts, but now they are all out.—MRS. A. F., Keeseville, N. Y.

I never saw anything like the work of Paratabs. It reminds me of the fairy story of the magic wand. Early this year I was getting 14 to 16 eggs a day. Then, without visible cause, the number dropped to 5 to 7 a day. I began using Paratabs as directed and in 2 or 3 days there was a difference of 1 or 2 eggs a day. On the fifth day, I got 17 eggs and on the seventh I got 23. I heartily recommend Paratabs.—MRS. E. H., Centralia, Illinois.

I received the Paratabs all right and my hens seem to be laying better already.—MRS. W. S. C., Monticello, Ark.

I am giving Paratabs water to my chickens and am having better luck this year than ever before. I haven't had a little chick to be a bit sick. It is the greatest medicine we ever used for young chickens.—MRS. M. N., Pulaski, Ky.

SEND NO MONEY

Let US Take All the Risk

Any one can try Paratabs without risking a penny. We are so confident this new scientific discovery will free your flock of lice and mites that, to introduce Paratabs, we will send two full \$1 packages—enough for 200 gallons of water—for only \$1.00. BUT SEND NO MONEY. On delivery, pay the postman \$1 and postage, and if your flock is not free from lice and mites in 10 days, your money will be refunded without question. Don't let vermin kill your fowls and steal your profits. Write for the Paratabs today.

PARATAB LABORATORIES
Dept. 811, 1100 Coca-Cola Bldg., Kansas City, Mo.

Society cannot progress without respect for authority and order. No government is strong enough to last unless its citizens respect authority and obey the law. No association can last if it is composed of out-laws; and the individual breeder cannot progress without the protection and security which generally accented Standard law affords.

There will be an opportunity at Knoxville to help make the law and make it right. Let us go there, not in a spirit of defiance as if we were soon to become enemies of the law. Let us go as breeders and judges sworn to uphold the law, to strengthen the hands of the law, and to write new laws that will be good laws.

The Standard Committee did not overstep its authority in making changes in the Standard submitted by the White Orpington Club. Mr. Lyle states that the A. P. A. constitution provides that the Standard Committee must accept the Standards of specialty clubs, but he over looks the further injunction that the Standard Committee "shall edit the whole Standard so as to secure uniformity of technical forms and expressions."

In the matter of back, the club's proposed description did not conform to the common wording of the Standard. The committee endeavored to give the breeders what they want, using the established style of wording.

The Club asked for "breadth over base at tail nearly as great as between wings at shoulders." No where in the Standard is width "between wings" referred to. A good Orpington cock is perhaps six inches wide between his wings. To say that the width across his saddle should be nearly as great as the width between his wings, would make a bird less than six inches wide across the saddle. A good Orpington cock is nine inches wide across saddle and ten inches wide across shoulders.

The ideal bird is one that is wide across his shoulders, and carries that width well back to broad tail. To describe this ideal back of the ideal male, the Standard Committee adopted the following definition: "Back, broad, flat at shoulders, of medium length; widely carried well back to base of tail; rising with a slight concave sweep to tail; saddle feathers, of medium length, abundant."

The back is an important section of an Orpington. More money has been spent for breadth of back and saddle in Orpington males than for any other quality. It will continue to be the point of most desire unless the Knoxville convention decides that an Orpington shall have a slight tip forward. That would afford a new field for conquest, and the Standard Committee feared that it would start "slight" and end with the crouching forward carriage of the old Cochin.

The Standard Committee assumed that it was its job to consider all such points; not merely rubber stamp with the word "approved" all Standards submitted; but actually do a little work. Perhaps the committee failed; if so, it is a case of earnest, conscientious workmen having done the best they could—and failed.

Gentlemen.

Gentlemen are always gentlemen, not alone in agreement, but also in disagreement.

One gentleman breeder of Illinois, writes: "It seems that every change that the Standard Committee recommended has been for the better. I have read every word of your articles in the April and May Journals, and am much gratified to learn that the committee seemed to be working along practical lines."

Another gentleman in New York, writes: "The Standard Committee, in my opinion, has closed its discussions and announced its findings. Whatever it does, right or wrong, will be criticised. It is up to the A. P. A. meeting to receive the report for adoption or rejection in part or whole. While I feel the Black Giants should be admitted to the Standard is no reason why I should condemn the members of the committee who consistently opposed their admission. We cannot all think or see alike."

Again, a gentleman in Indiana, writes: "In my opinion it is a grave mistake for breeders of Rhode Island Whites to harshly criticize the action of the committee. There were numerous letters and other forms of protest against the admission of R. I. Whites. I believe these fowls should be admitted, but unkind words against either the judgment or integrity of the committee will get the petitioners nothing."

Such are the individual and honorable opinions held by real men, and only in decent frankness and sane discussion will members of the A. P. A. find the lost chord of harmony at Knoxville.

The charge of "Star Chamber Sessions" has been made because the Standard Committee instructed reporters of the poultry press not to give the names of those who made motions in connection with the detailed work of reading, altering, correcting and revising the 368 page book, called the Standard.

A breeder in Texas writes:

"What kind of intrigue was carried on? One would think the meeting was held in Russia under the regime of the old Czar."

Here are the facts:

At no time was the door to the committee's sessions closed. Anyone who wished to attend could come when he chose, stay as long as he liked, and leave when other business called.

The committee granted the privilege of the floor at all times to members of the press.

The committee gave reporters access to every detail of the report.

There was no censorship; each reporter could print as much or as little as he liked; except this: the reporter was instructed to tell what the committee did, not what individual members said or did.

The reason that reporters were asked to withhold names was because it was agreed among the committeemen that while each member should have the opportunity to fully discuss each question, the motions as they were finally adopted should represent the attitude of the committee and not an individual.

Why are editorials not signed? Because they represent the attitude of a publication, not an individual.

It fell to the lot of this writer, among other things, to rewrite a number of the introductory chapters to the different breeds. It would be unfair to the rest of the committee to say to the interested public: "I did it—look at me!" What we did was to put in words, with such facility of pen as we command, the ideas of the committee.

Individual members sought to bury their personality to the point of self-effacement, believing that the one way to success was over the broad and open high way of service. And service in this case meant fourteen days of industry, respect for authority, and recognition of the rights of others.

There is strong agitation, both east and west, to include in the new Standard idealized illustrations of the male and female of every Standard variety.

The suggestion is a good one. Golden Wyandotte breeders, for instance, are naturally chagrined when they anticipate the 1923 edition of the Standard with all of the eight Wyandotte varieties illustrated except the Golden Laced. It is a condition that is unfair to the breeders of Golden and works an injustice to their variety. That is one instance of many omissions in the Standard.

There is another side to the question, and those who are urging the A. P. A. to illustrate the entire Standard apparently overlook the handicap under which the A. P. A. is laboring. Its finances are at low ebb. Fifteen hundred dollars worth of art work has already been ordered for the 1923 Standard. The artist who is to do this work has no assurance that his bills will be promptly paid.

The new Standard will undoubtedly have to be printed by a publishing house that will extend credit.

Members should realize that making a Standard costs thousands upon thousands of dollars, and the need at this time is for the common sense of the breeders of America to assert itself.

It is time that members realized that life membership fees have been spent, and the old association is loaded with liabilities in the form of life members, and has about exhausted its liquid assets.

The finances of the organization were in a bad way twenty years ago. That condition brought about an activity that made the Association the most prosperous in its half century of history. This time a similar condition can again be made to bring about a reorganization that will prove beneficial and profitable.

Let every active breeder and judge of purebred poultry plan now to spend his summer vacation at Knoxville, in the mountains of Tennessee, the second week in August. And let us go to Knoxville realizing the need of horse sense and co-operation. We will have to pull together boys.

Altogether too much distrust and dissension has been stirred up in the fraternity. Let us pick up the broken threads of faith and tie them together in a new knot.

In the fabric of life, the strongest threads, and those that weave into the most wonderful patterns, are the threads of faith. Cut those threads and there can be no organization of society.

Lack of faith has sent Europe to the brink of ruin. Piles of gold lie idle in the money markets of the world, yet there are no loans to impoverished Germany or famine stricken Russia, because credit and confidence departed when the ties of faith were cut. Before there can be resumption of business, faith must be strengthened.

Let us focus our vision of what might be done, to the near at hand reality of what can be done and then let us sign it "faithfully yours." It is time to be practical minded, not losing confidence. Breeders must have faith in one another, faith in the future of their organization, faith that all things work together for good.

A Radio Message for You

A new, unique circular just issued free from the Home of World's Champion Layers, broadcasting poultry profits to the four quarters of the globe.

In it, you catch the signals from Japan, Hawaii, Trinidad, Cuba, Mexico and Nova Scotia, where shipments of our stock are now busy on heavy-laying programs.

Old English Game Bantams

In the last few years people and fanciers have been beginning to realize the efficiency of the Bantam hen as a producer and the joys of breeding them for their beauty and the pleasure derived therefrom in exhibiting where one will always find the best of sports, the kind who are in it for sportsmanship.

In England today bantams are considered very much more by the fanciers than in this country, probably because they more fully realize their utility values and they have realized that it is impossible for one, where his rearing space is limited, to keep up the pace in producing birds capable of holding their own with those who have unlimited space to properly rear their youngsters. One can propagate a strain of bantams in a small back yard and compete with all the "boys," due to the fact that bantams will do well under confinement where large birds would not thrive.

Of all breeds of bantams both ornamental and game we have one very much neglected by us in this country namely Old English Game Bantams. Not so in England where they are more popular than any other variety. I hope and am certain that very soon we will see more of this variety in our shows than any other.

As to color, there is no end for the novice to choose, as they come in all the recognized Modern Game colors as well as a dozen other colors, and also some are bred muffed and tasseled.

Their shape is that of a pit cock having all their characteristics as to strength, courage and hardiness. All these characters with the type they possess stamp them as our best utility fowl among the miggets, and in this respect they are not to be surpassed by any. The pullets develop into maturity and start to lay at an early age and continue to do so. As a rule they have no tendency to go broody as pullets, being too anxious to lay. As hens they are more or less subject to nature's call to broodiness and here they fill the bill beyond comparison, ready to defend their eggs and chicks until death. They are very careful with their brood of chicks and will not smash all the youngsters.

Bantams As Layers

I would like to see a pen of nice pullets fed and taken care of under same conditions as a pen of Reds, Rocks or Leghorns and I will promise that taking weight of feed consumed and weight of eggs produced, the bantams will produce a higher profit than the larger fowl.

It is not the purpose of this article to have all commercial farms switch over to bantams but the back-yarder or the business man who wants a relaxation from his daily toils and worries will find them both profitable and pleasant to keep. For the real fancier who loves chickens, loves the lore of a poultry show and must have the presence of poultry near him, he will never regret the time and money invested in establishing a stud of Old English Game Bantams because the sport will be there, and the fancier will find lots of money rolling in from the sales of these little birds, as the demand is far greater than the quantity that are being bred and imported today.

Hardiness.

After personally breeding Modern Games, Cochins, Rose Combs, Sebrights, Polish, Brahmas, and various other bantams, I have found I can raise two and possibly three Old English bantams to one of any other variety due to their positive hardiness. They seem to thrive anywhere and under any care, apparently taking care of themselves. The parent stock lay well and exceptionally strong fertility in the eggs is the rule. They are not bothered with the various circumstances which hinder the proper fertilization of eggs by the male. Then their rugged disposition stays in the germ, hatching out a strong healthy chick which is the start in life we all like them to have.

My hatching and brooding is all done by artificial methods and I have been very successful, raising over five hundred to maturity last season.

The type of an Old English Game Bantam should be a miniature pit fowl or game cock carrying all his characteristic courage and proudness, always defying the world and letting one know he is master of all he surveys. He lets nothing detract from him. His head should be erect, of medium length, strong and bold; strong beak and slightly curved, not too long; large bright eyes, prominent and full of expression. Cock's comb and wattles neatly dubbed, hen's comb small and evenly serrated. Neck long and very strong at juncture with body;

neck hackle wiry, long feathers covering the shoulders; wings full and round, inclining to meet under the tail with strong prominent butts, feathers broad and furnished with hard quills, primaries not too long and nicely rounded at ends projecting past the body as little as possible. Back short, broad across the shoulders, tapering to the tail. Tail carried at a nice angle, neither too low nor too high, with broad and strong feathers, furnished with a good pair of curved sickles, and well furnished with side hangers. Breast full, broad and well rounded. Body and stern; the breast bone straight and medium in depth, tapering well up behind, forming a compact belly. The whole body with wings, seen from the top, to appear flat and resembling old fashioned flat iron. Legs; thighs short, thick and muscular but not extremely short; legs set well apart; shanks of medium length with good round bone. Avoid flat shins, in-keeened or bowlegged specimens. Toes, clean, even, long and spreading, good back toe not duck-footed. Plumage hard, glossy and firm. Station, bold, smart movement, quick and graceful. The hen to be similar in conformation.

As to color, as I have said before, there is no end, such as Spangled, Black Red or Partridge, Wheaton or Clay, Golden and Silver Duckwing, Blue Red, Self Blue, Birch, Brown Red, Pyle Crele or Dom. Black, White, Furnace, Brassyback and many others. Here are splendid opportunities for the fancier to choose color to his liking and produce the best as there is nothing more beautiful than the glossy and distinct markings of a good colored game bantam. But let us all remember type is the first point to strive after as that denotes the breed, and color is the secondary consideration.

Here the color artist will be right at home. One very interesting fact concerning production of colors to the man who has only limited space: From one pen he can produce several colors of the very best. For instance, we will procure a good-typed Wheaton or Clayborn male, to head up our pen. Then we will secure for his mates a Wheaton female, Duckwing female, Blue Red female. Now from this mating we can expect the best of Clayborns or Wheatons, Golden Duckwing males, and Blue Reds.

Pa. Dr. N. L. May.

Care of Baby Chicks.

At this season of the year, when the sun gets up earlier and stays up later, and it gets bright and warm in the middle of the day, "a young man's fancy lightly turns to thoughts of baby chicks."

Then arises the question of how best to handle them in order to raise them successfully. From my own experience and observation I will enumerate a few points.

First comes the question of where to get them. Of course, they can be hatched under hens or in incubators. If you use these methods be sure the eggs are from good, vigorous, pure-bred stock.

Dust the hen with lice powder while she is sitting and then be on the lookout for lice on the chicks. There are very few adult birds that haven't a few lice on them, and just a few on chicks are disastrous.

Some years ago when I started in the business "down in old Kentucky," in two weeks I lost 50 out of 51 chicks that I had with hens, before I found out what was causing the loss. Those hens were not particularly lousy either. If there are lice present on the chicks you will find them under their wings and on their heads. A little vaseline or lard generally eliminates the trouble. Do not use too much or you may stunt the growth of the chicks. With an incubator you do not have this trouble right at the start but it is well to keep your eyes open.

If you buy day-old chicks, do not get the cheapest grade if you want to be sure of good results. It is just like every thing else, the more you pay the better quality you will get. You cannot buy a Packard for the price of a Ford. Of course, they'll both run, but "there's a difference."

The same with chicks—cheap ones and good ones may both grow, but the better the grade the more certain you are to raise them.

It is better to buy as close to home as you can. One reason is that you are helping your neighbors and those doing business close to you. The main reason, though, is that when you buy close at hand you avoid the long journey by Parcel Post with the chances of chilling on the way. Get your chicks early but not so early that you will run across some cold weather unless your chicken house and brooder are able to keep

Why Basic Feeds Growing Mash Promotes Faster Growth and Development

Poultry raisers who are feeding Basic Feeds Growing Mash and Basic Feeds Developing Wet Mash are enthusiastic in their praise of this feed. In their reports to us they invariably state that never in their experience have they been able by any other method of feeding to get such rapid healthy even growth, quick development and perfect finish as they do with these feeds.

Such reports coming from well known successful poultrymen like A. F. Rolfe, Chas. V. Keeler, M. L. Chapman, C. S. Byers, F. D. Rogers, H. P. McKean and hundreds of others is evidence that Basic Feeds Growing Mash and Basic Feeds Developing Wet Mash do have unusual merit. There is a reason for it—a very outstanding reason and one that we would like to drive home to every poultry raiser and that is

The QUALITY Is In the Feed

If you could visit our mill and see the choice selected Wheat, Bran, Wheat Middlings, Rolled Oats, Rice, Corn, Hulled Barley, Bone Meal, Beef Scraps and Dried Buttermilk that goes to make up Basic Feeds Growing Mash, you would then understand why Basic Feeds excel—you would see that they are A-1 quality through and through—100 per cent feeds and that's why Basic Feeds Growing Mash Promotes Faster Growth and development of growing birds.

Write today for our Chick Welfare Bulletin and money saving price list telling all about our complete line of QUALITY feeds—let us show you how you can reduce your feeding costs and how we can help you get better results.

THORNTOWN, INDIANA

Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying. Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 215, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

Write for full particulars
GEO. RUSSELL, Box 72, CHILHOWEE, MO.

the chicks good and warm. Chilling is one of the worst enemies of the poultry keeper. A chick once chilled will never be the same even though it does recover.

When you get the chicks from the Post Office be sure they are not chilled on the way home. Put them in the brooder at once, having previously regulated it to a temperature of 95 to 100 degrees. Keep them inside for a while, until they get good and warm. Have some 10 or 12 inch boards, or quarter inch mesh netting ready with which to fence in the brooder to keep the chicks close to it, and gradually widen out the fence as the chicks gets to know just where the heat is.

Drop the temperature about 5 degrees a week until you get it down to 80 degrees. These temperatures must be varied a little according to the weather. If it is quite chilly or damp, give them a little more heat; if they don't want it they'll get away from it. Let them have heat until 6 or 8 weeks old, in ordinary weather. You can tell when they do not need it any longer; they will be well feathered and spread out at night. Of course, when weaning them from the heat, watch out for sudden changes in the weather, or damp spells, and put the heat back for a night or two if necessary.

Now, as to what to feed. Probably you have noticed that the State Experiment Stations and the Government Agricultural Department always give a ration to feed that you mix yourself. These are good, of course, but very few people can or care to go to the trouble of mixing feeds. Luckily there are many good poultry feeds on the market. Go to a store that handles a reliable brand and get the circulars the mixers publish. These will tell you how to feed that particular feed. Then follow this out as nearly as you can.

Remember, there is no one best feed, just as there is no one best breed or variety of chickens. All depends upon the operator. It is the same with other things. Thousands of women bake excellent bread and use hundreds of kinds of flour. All swear by their favorite brand and would almost swear at any other brand. Just adopt one brand of feed, stick to it, follow the directions and be like the Woodpecker who gets there by using his head.

Sour milk or buttermilk are among the best liquid foods for chicks, but you may have to create an appetite for it. I find that at first it is better to give them only sour milk or buttermilk to drink. After they learn to like it then put in water fountains also.

Never put milk in galvanized fountains or pans—the acid in it eats the metal. Use only glass or earthenware. A glass inverted in a saucer, or a small bowl inverted in a larger, shallow one works fine and they must always be kept clean enough for you to use yourself. Never feed old milk or foods that are moldy or bad. A good rule to follow is—Feed nothing you would not eat yourself, if your tastes ran along the same lines as those of a chicken.

Have a thin layer of fine cut straw, clover, etc., on the floor and make it thicker as the chicks grow older—make it an inch for each week the chicks are old. Change this often enough to keep it from getting very dirty. Keep chick size grit and oyster shell before them. Give them green feed after 3 or 4 days or a week, according to their development. And above all things, keep plenty of fresh water and milk before them at all times.

Sour or buttermilk will help to correct digestive trouble. If the chicks develop diarrhea you can't often cure the sick ones, and the rest of the flock are better off if the sick ones are killed and burned.

Give the chicks plenty of fresh air but enable them to get back to the heat when they want to. Let them get out in the air as soon as possible, even on cold days. Give them a rather small open air space at first and gradually enlarge it after they know what the door of the house is for and get sense enough to go back when they get cold.

When they show signs of wanting to roost, give them some boards to roost upon. Boards 3 or 4 inches wide and raised 6 or 8 inches from the floor will do. Better start them just squatting on the wide boards in order to prevent crowding and to keep them clean, and to avoid crooked backs, breasts, etc.

After they get to know their home, say at the age of 6 or 8 weeks, give them free range if you are situated so you can, but remember the neighbors' gardens, also their cats and dogs may like nice young broilers. If you can't give them range, give them as much yard as you can. Don't try to keep the Mediterranean breeds in with a 6 foot fence. This will do for the heavier breeds

Market Your Eggs in Neat, Compact and Safe Self-Locking Egg Cartons

"the box that sells the eggs"

A big help in getting highest prices for your eggs. Note how much larger the eggs appear! and how good!

A. C. Schwertman.

Light and Dark Barred Rocks.

I have read the article on page 618 of the May issue by L. D. De Villeracy, and can not help but write these few lines to express my opinion in the matter. I have been breeding the grand old breed for nearly 20 years and feel that my experience should be worth something.

In the article above referred to the writer admits his youngness in the matter, yet feels very confident of his ability to tell what is what in breeding Barred Rocks. He lauds Thompson and Cosh as being worthy of consideration in this matter to the apparent exclusion of W. D. Holterman, who, though an advocate of the light and dark proposition, has done more in recent years to develop interest in Barred Rocks than any other breeds.

Not long ago I read an article in the American by one who claimed to know that the two lines were drawing closer together. To me this indicates nothing whatever, as any careful breeder can, in a few years, make his light lines as dark as he wishes, and the reverse applies to the dark line. I'll venture to say that whatever the color or tone of color in either line, the female is still about the same number of shades darker than her full brother; and this is the point that needs correction. Just as long as the Standard of Perfection calls for the exhibition male and female to match in shade and color will we have with us the light and dark matings.

From what I can learn the Barred Rocks are not the only breed that is double mated to produce choice exhibition specimens, but this variety seems to be bearing the brunt of the blame and by many are condemned on this account. If the truth were admitted the practice of double mating is becoming more and more general among many, many breeders of other varieties, the chief difference being that the Barred Rock breeders have drawn aside the curtain and are making an effort to clear up the so-called mysteries of the breed.

Through the efforts of our best breeders to produce males and females to meet the Standard requirements, two very wonderful and beautiful varieties have been developed, either of which is worthy of a place in any show room, in both male and female classes, so why not exhibit them both as they are bred and do away with the so-called exhibition pen as called for by the Standard, which is contrary absolutely to the dictates of nature. I have never yet seen full brothers and sisters come any where near matching in shade of color even though matings in both lines may be very similar in appearance.

Why not abolish this misleading requirement in the exhibition pen and either have the two separate varieties, or have a Standard with the male admittedly lighter than the female, and an accurate description given as to the proper barring and color proportions required for each?

This latter plan would, however, necessitate the loss of thousands and thousands of dollars and much valuable time and experience by the present day breeders and virtually compel them to start all over. The simple and practical thing to do is to show and judge as we breed, in two separate lines, and thus let the one line breeder show his males and females, thus doing away with the so-called exhibition pen as is being done in Mr. Hewes' shows and many, many others today.

Ill.

Chas. Morgan.

(Note: The above argument in favor of dividing the Barred Plymouth Rock into two varieties is a very fair presentation of the case as held by a large number of breeders. What will happen if this course is pursued? I will tell you what is happening in Brown Leghorns. The Light or pullet-bred line is losing ground. It is freely predicted that the same thing would happen in Barred Rocks, for you would no longer have one variety, but two varieties that were in close competition with one another. If the present exhibition female is worth preserving, the present Standard is worth preserving. F. L. P.)

Rid Hens & Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy in Drinking Water Does It—No Dusting, Spraying or Greasing.

Any poultry raiser can easily and quickly clean out Lice and Mites by using a new remedy recently discovered by a Kansas City Chemist and called Imperial Lice and Mite Remedy.

All that is necessary is to occasionally put a few drops of this amazing remedy in the fowl's drinking water. It renders them immune from the attack of all blood-sucking parasites, as these pests positively will not stay on a fowl taking this remedy.

It also acts as a splendid Tonic and Blood Purifier, as well as increasing egg production and growth, for with these pests eliminated, hens lay better and young stock grows faster. It is positively guaranteed not to affect the meat or eggs.

The manufacturers of Imperial Lice and Mite Remedy are anxious to get it quickly introduced among poultry raisers everywhere, and make this Special Introductory Offer. Send no money, just your name and address to the Imperial Laboratories, Room 636, 2110 Grand Ave., Kansas City, Mo., and they will send you a regular full sized \$1.00 bottle and will also send you free a big full sized (double strength) \$1.00 package of Imperial White Diarrhea Remedy, the standard, time-tested remedy. Pay the postman only \$1.00 and a few cents postage when both packages are delivered. Any time within 30 days, if you are not satisfied with results, just say so and your money will be cheerfully refunded.—Advertisement.

A Dangerous Poultry Pest.

By F. C. Bishopp of the United States Bureau of Entomology.

An addition to the ranks of the enemies of the poultrymen is among us. Poultry are already beset with parasites. Many species of lice gnaw on their skin and feathers; the roost mite and the fowl tick suck their blood; the fleas, chiggers, depluming mites and scaly leg mites attack them, and now comes the feather mite. This persistent little blood sucker is even worse than the common red or roost mite with which we are quite familiar.

Since 1917, the United States Bureau of Entomology has been keeping watch on this pest which was not previously known as a pest of domestic fowls. Its first recorded occurrence was in the poultry flock of the United States Bureau of Animal Industry at Beltsville, Maryland. A few months later it was sent in from a commercial flock at Raymond, Illinois, then it was found in northern New York, central Indiana, and within the last few months it has been found in two points in Canada, and near Minneapolis, Minnesota.

As a result of work carried out at Raymond, Ill., by H. P. Wood of the Bureau of Entomology, a pamphlet was issued by the Department of Agriculture in January, 1920. That author added considerable to our knowledge of the life history and habits of the pest and discovered a treatment which would completely stamp it out. At the time this pamphlet was issued some experts were of the opinion that the mite was the same as the species known to prey upon domestic fowls in the tropics, and commonly called the tropical fowl mite. Further study of the specimens indicates that this first conclusion was wrong. Furthermore, the appearance of the mite as a poultry parasite, largely in northern latitudes, while it has never been recorded in the Southern States, further strengthens the view that it is not that species.

Not the Common Roost Mite.

The appearance of the individual mites is very similar but the mature feather mite is somewhat smaller than the common roost mite, and the female shows a lobed or notched abdomen. The feather mite also crawls about faster than the roost mite. The most striking difference, and one which poultrymen should depend upon to separate the species, is the fact that the feather mite remains on the fowls constantly and lays its eggs and breeds among the feathers, hence the common name which is here given. While an occasional specimen of the common mite may be found among the feathers it is not their normal habit to remain on the fowls during the day, the feeding being done largely at night, except on nesting hens. The feather mite usually congregates in great numbers among the feathers below the vent, but not every fowl in the flock is heavily infested. The presence of the mites and their eggs, molted skins and excrement give the feathers in that region a dirty appearance which, if bad, will quickly attract attention.

Seriousness of Parasite.

The fact that this mite remains on the fowls continually adds to its dangerousness. It has been known to kill fowls outright when the mites were very abundant and the sitting hens are frequently driven off their eggs by its attack. One of the principal dangers, however, is the ease with which the mite can be spread from

from one flock to another even over great distances by the shipment of infested birds. Furthermore, while, as has been stated, the mite can be completely eradicated its destruction is considerably more difficult than is the roost mite.

How Chickens May Become Infested.

An effort has been made to determine the source of the mites in each of the flocks where it has occurred, but no definite information on this point has been obtained. It is certain that owing to the habits of the mite of crawling from a fowl to the nesting material or adjacent fowls that birds may become infested at poultry shows. And the ease with which the mites can be introduced into a flock by shipment of infested birds or infested packing is apparent. Examination of a number of wild birds indicated that they were not infested. English sparrows, however, were found to harbor these mites to some extent, both on their bodies and in their nests. While it seems probable that

the trouble at least in some of these outbreaks, has been derived from some wild bird, it is firmly believed that the main danger to the poultry industry is through commercial channels.

Fighting the Pest.

Two or three treatments have been found to be successful in destroying all of the mites on the fowls, but the following is recommended above others: Dip all fowls except baby chicks in a tub of the following mixtures: Flowers of sulphur or powdered sulphur, two ounces; laundry soap, one ounce; water, one gallon. The soap should first be dissolved in warm water and the sulphur stirred in. The tub should be filled so that the fowl can be completely immersed. While being held in the solution with one hand the feathers beneath should be ruffled with the other so as to allow penetration by the dip. The head should also be ducked once or twice. This dipping will thoroughly wet the fowls and can only be practiced when the weather is warm and sunny. For winter treatment dust all chickens thoroughly with powdered or flowers of sulphur. Since the baby chicks do not harbor the mites, at least to any extent, their treatment does not seem to be necessary provided the mother is well dusted. Along with this general treatment of the fowls the nest and scratch materials should be cleaned up and burned and the nests,

Female feather mite greatly enlarged.

The "Feather Mites" eat and know at the feathers. Evidence of presence of the "Feather Mite" shown above.

dropping boards and floor and walls of the chicken house and coops sprayed with the wood preservative known as carbolineum or anthracene oil. If this material is not obtainable a good grade of creosote oil may be used. The fresh nesting material should be dusted with flowers of sulphur. If the runs are shady and feathers are numerous in them it is best to spray them lightly with the same material as they sometimes harbor the mites.

This method of treatment has been demonstrated to absolutely eradicate the feather mites from a flock, as in the yards at Raymond, Ill., which were treated this way in 1919 by Mr. Wood, no mites have been seen since.

Eradicating the Pest.

It is the desire of the Department of Agriculture, and undoubtedly also of the various poultry interests of the country, that this dangerous pest be prevented from spreading widely and not even be allowed to remain in a single flock within the United States. The Department appeals to every poultry raiser to co-operate in this undertaking. In the first place it is desirable that the presence of the pest be recognized early and positively. Should any suspicious mites be found a few of the feathers infested with the mites should be placed in two per cent formalin and mailed to the Bureau of Entomology, Box 208, Dallas, Texas, for positive identification. Every assistance will be let to stamp out the pest in case it is found and it is believed that no conscientious breeder will aid in its spread by making shipment of fowls after its presence has been discovered, until it is eradicated.

Allied Poultry Show Association.

By D. Lincoln Orr

No business, no sporting event, really nothing can succeed unless it has a Supreme Court and the less in number belonging to that court, the better. Now let's talk poultry organization. There is an organization that has partially functioned because the poultry breeders of America have been good sports. It never has had a supreme court. If the present board is supposed to be one there is nothing it has done that could be hailed as a step a la Landis-Hays. It gives birth but never nourishes. The poultry business today needs a Judge Landis or a Will Hays. For the past 10 years or more the papers, the aisles, the cloak rooms have been reeking with all sorts of gossip about the poultry judges, shows and exhibitors with no one to lift a hand, with no Judge Landis to suspend for 38 days, or a Will Hays to put on a ban. This great organization with its boasted "9,000 membership and a billion dollar industry," seemingly is satisfied to license judges, issue standards, sell supplies and get members. Even when a member is proven not worthy, the association does not always care to expel.

Within the last 3 years and personally to me in the presence of the President of the A. P. A., one judge talked shamefully about another's judging, both licensed. As yet I have not heard of any action being taken by the Association. No association will ever be able to control such a vast, widespread industry such as is crystalized in the poultry shows until it gets a Supreme Court and one that has the future good at heart.

The American Poultry Association, in my humble opinion, has utterly failed in its handling of the Shows. The time has arrived when this must cease and the house put in order. Perhaps a Babe Ruth or a Fatty Arbuckle will have to be sidetracked for a while, but what is the harm if the sport or business is advanced to a higher level. Others can make home runs and throw pies.

Then again the inconsistency shown in admitting breeds and varieties in the Standard. No show secretary will ever refuse a bird if he has the room. All secretaries will make classes for any variety, standard or non-standard, if guaranteed a full class. In my humble opinion it is not necessary for a breed's welfare to be admitted to the Standard of Perfection. I believe any association making a business of listing varieties in a Standard should accept any and all varieties and list these separately on probation. If found worthy and popular, then 5 years later put them in the Stand-

ard, but this Standard business is aside from the main thought.

There is much talk about getting birds ready for a show in ways that are not just according to law. Ability as a breeder should be the final test and added to that a good legitimate conditioner, but no one seems to be willing to play Judge Landis.

The poultry exhibiting business is good wholesome sport. It is international in scope. It is clean, healthy and not expensive when taken in comparison with other sports or pastimes. I have looked into many Associations lately such as cattle clubs, kennel clubs, trotting associations, and it is with amazement that I turn back and view the lack of authority with power that rules the poultry show world.

The League of American Poultry Shows or whatever will be its official name when its constitution is finally adopted, will be an organization formulated and copied after known successes, for example, the baseball league, the kennel club, the jockey club, the trotting association and many others.

It will acknowledge no higher power, no other authority in so far as the management of its poultry shows is concerned, and everybody that participates at its several shows must conform to its rules regardless of any other affiliations.

We will have our Supreme Court which will have authority with power so that any sentence pronounced by the court against any judge, editor, exhibitor or show secretary will be final and binding. We are going to stop rule breaking even if we have to suspend a Babe Ruth. No one need be afraid whose ambitions and intent is right.

Reports on Revision.

By Theo. Hewes.

I have read with a lot of interest the several reports that have been published on the work of the Revision Committee, and it seems the boys treated us mighty nice, even though they may not agree with us in all we did. There seems to be a disposition to take us as being at least dead in earnest and trying to do the best thing in the best way we could, and if we find this same sentiment in the Knoxville meeting we are going to finish the job in a way that every fancier in the country will be proud of.

Each member of the Committee knows there are going to be some good suggestions made to us at that time, and I know the majority of our committee will welcome these suggestions. We are only your hired men, and we have done the best day's work we knew how to do, and we want you to tell us right out in meeting whether we did the work to your satisfaction, and if not, point out the weak spots.

To the reporters who followed us through the long sessions and made their reports to their journals, I want to say THANK YOU.

It must have been a tedious job for these boys to set there day after day, not taking part in the debates, but waiting patiently for us to agree on the many points that in many instances led us far afield. I know it must have looked to you like we were killing a lot of time on some minor points—time that might have been better used in some other direction.

I note Mr. Robinson refers to one or two points of this kind and rather censures Mr. Platt in two cases where I feel if any one is to be censured, I am the one to blame. In regard to the description of the lower thigh, we have tried for several revisions to get the proper description and in every case we quit before we finished. Platt's suggestion of calling it the "drum-stick" did not meet with the committee's idea of the proper name, but at that it was the homely phrase that best fits it. But the point I wish to cover is that it was important that this section have a proper description, and that we not go on forever using a term that we all know was wrong; and it was Platt's persistency that finally brought it about.

In regard to non-important breeds and time taken up on them, I told Mr. Platt when he was added to the committee that I believed some of the old breeds might be revived if we gave them a little more consideration and did not pass them over as we have been in the habit of doing, and I was glad to see him take this interest. I really believe the effort to give a better description to some of the breeds that are almost obsolete was the best work we did, and I hope to see the breeders of these old time favorites take a new lease on life and push out these varieties where the public may become better acquainted with them.

Morris' White Orpington Farm

Puts on Half Price Sale of HALF THEIR 1922 BREEDING STOCK

Our breeding season ends July 1st. We have 800 fine growing pullets and 800 cockerels, some weighing 4 lbs., the finest we ever had at this early date, May 1st. They are needing more room every week. We are offering to sell at HALF PRICE, good through July, August and September, half the females and a few of the males from our various matings, including our Special All-Star Matings, Exhibition Matings, Special Egg-Laying Matings and our General Matings. We reserve the right to refuse to sell certain individuals. This is a real opportunity to get proven combined exhibition egg-laying stock cheap. Get the female end of your foundation stock while the "getting is good" and we will supply you with the Cockerel to properly mate to them when the cockerels are sufficiently matured that we know what we are sending. Get real White Orpington blood lines at the "Home Farm" for White Orpingtons. We will satisfy you in value or you can return the stock and get your money back. Get our 1922 Mating List and see what real value we are offering.

Revising the Standard.

By E. H. Hoffman.

Within a short time the American Poultry Association will revise its Standard of Perfection and the changes that are to be made will be in force for some time to come, so it is very important that great care be taken to make no changes or additions but what will be for the best interests of the poultry business, especially the branch of the industry that has built up its present magnitude and that is the standard or so-called fancy end of it. The breeds and varieties that are now in the Standard must be protected against the admission of others that are nothing more than an infringement upon them, or, in other words, a duplication. The work that was done at a meeting of the revision committee a short time ago and the recommendations that the committee will make to the American Poultry Association at its next annual convention to be held at Knoxville, should be indorsed by every member of the association who has the interest of standard breeds and their future at heart. Much has been said regarding the admission of some of the so-called new breeds that are asking for recognition in the Standard, but, without much comment, I believe the action taken by the committee was wise in every particular and it is hoped that the majority will uphold its action at the coming convention. I believe and am a firm advocate of admitting any new breed or new variety if it has sufficient merit to warrant it, but I am opposed to dividing every breed into two varieties, merely to satisfy the likes of a few and to the detriment of many.

With regard to making certain slight changes in the Standard of some of the breeds that we already have, these matters have been taken up by the various specialty clubs and no doubt every change that has been recommended will meet the approval of the breeders of those classes in which they are interested. Adding a half pound to the weights of some breeds or slightly changing the color or shape descriptions are things that are not serious and will not in any way work against the interests of the breeds affected, so there can not be much if any criticism along these lines.

There are other things, however, that are of vital importance to the poultry industry that should have careful attention before the standard is finally accepted and published. In this connection let me mention the utility end of it. Some of the commercial poultry men insist upon infusing certain things into the standard that cannot help but work a hardship to the fancy. Conflicting the two is dangerous and one or the other is sure to suffer. The regular Standard of Perfection should be devoted to describing the breeds and varieties as to shape and color, laying down rules for judging; and illustrating the different breeds and varieties. Beyond that I can see nothing to be gained by filling it full of other matter relative to producing laying strains, improving egg production and the like. These things have no place in the Standard of Perfection. On the other hand, if the American Poultry Association should see fit to go into the publishing business to a greater extent, then a separate utility standard might be produced and in this standard could be inserted descriptions of the egg laying strains, how to Hoganize, how to raise early broilers and other matters that would be of interest to the commercial poultryman, who cares nothing about Standard requirements and exhibition qualifications. It is a well known fact that many of the exhibition lines of various breeds have been greatly improved along egg lines, but that can be done by the individual if he keeps close to Standard requirements. Confusing these two branches of the poultry business would not work out to the best advantage in any way.

I believe, however, that a strict set of rules should be laid down and published in the Standard regarding the management of poultry shows that are conducted under the rules of the American Poultry Association. Many little questions arise at shows that must be decided by the judges, whereas if these matters were covered in a set of rules, published in the Standard, there would be no confusion and no cause for complaint. For instance, in some shows where dark and light matings of Barred

The Schwalge Sectional Incubator

Price \$138.00

Our "Four in One" 800-Egg machine is the most practical for any poultryman, large or small. It has FOUR independent egg chambers (of 200-egg capacity); each is a complete incubator in itself. With this one section you can set FOUR different kinds of eggs at once or take off a hatch once a week, as you choose. It may be enlarged to a mammoth machine of 9600 egg capacity by adding more sections as required.

The Schwalge Fresh Air Brooder

(PATENT PENDING)

Provides Fresh Air Below Hover—No Crowding

Two very essential features. No lamp fumes can enter below the hover and the same heating principle is applied as to our or any first-class incubator. Fresh air continually circulates from the center of the hover to the outside. The chicks, instead of crowding to the center, move away from it and lie in a circle near the outside of the hover.

Hover 4 ft. in diameter. Accommodates from 400 to 500 chicks. Price \$28.00

Send for a copy of our catalog.

We give the most far reaching guarantee on both Incubator and Brooder that any responsible firm is able give on their product.

MADISON SQUARE GARDEN POULTRY SHOW

offers you free copy Buyers' Guide (list of exhibitors), The Red Book of the poultry show, also free copy Chicken Fancier.
Marked catalog names and addresses of all winners. Beautiful cover, price 75c, postpaid. Send for these books. D. Lincoln Orr, Sec'y., Box 1, Orrs Mills, Cornwall, N. Y.

Plymouth Rocks are shown, the question sometimes arises if these classes are allowed to compete for sweepstakes. Cockerel bred females and pullet bred males should not be counted in sweepstake classes, even if they are awarded prizes in special classes in which they are entered. Yet some show managements insist on figuring them into the number of points when sweepstakes are determined. I have always ruled that birds in these special classes cannot be figured because they are not in the Standard. Should the American Poultry Association see fit, however, to divide the Barred Plymouth Rocks into two varieties, the Dark and the Light, then they would be eligible to consideration in figuring sweepstake prizes.

Another rule that perhaps would work out well at all comparison shows would be to make it compulsory to place the weights of all birds upon the coops the same as in score card shows. This rule would not only give all exhibitors an equal chance, but would aid the judge in placing the awards. It would put a stop to placing small, immature birds over those that are standard weight. In my experience as a poultry judge I have found that one of the criticisms made by score card advocates against the comparison system of judging is that the weights are not considered. Most judges, I believe, take weight and size into consideration, but it is a certainty that if the weights were on the coops many under weight birds would go unplaced. When in doubt the judge is supposed to weigh the birds but very few comparison shows ever have a set of scales in the room even if the judge asks for them. I believe that a rule, compelling the managements to weigh all birds whether it be a score card or a comparison show, would work out to good advantage. In some cases where I have judged a show by comparison and sweepstakes were offered on the best bird in a certain class, such as all American breeds competing, and two birds were both very good in their respective breed, I have resorted to the weight clause, deciding by awarding the special to the one nearest Standard weight. In such cases it is often found that one bird is up to Standard weight, while the other is a pound or more under weight and still the latter does not show it with reference to size in the coop. Weights are important and should be considered in the comparison show as well as in the score card.

Coccidiosis in Young Chicks.

By T. B. Charles.

The organism causing Coccidiosis is designated *Eimeria (Coccidium) avium*. It belongs to a class of protozoan parasites known as sporozoa. It is included in the animal kingdom.

The disease affects chicks most commonly from the age of four to ten weeks, but may affect chicks much younger. The Coccidium when present in the digestive tract of the chick, develops rapidly in the cells of the intestinal mucosa; this gives rise to a large number of both sexual and

asexual forms which are voided in the droppings, which then become the means of general infection of the flock.

The chicks affected show signs of an interruption of the normal functioning of their digestive tract. They show the following general symptoms: Disordered feathers, droopy wings, bunched appearance, general weakness. The droppings become semi-fluid and usually whitish in color, or fluid with brownish tinge. In acute cases the droppings become bloody.

Examination of the Digestive Organs.

The lesions are confined principally to the intestinal tract. The caeca are usually distended, and are filled with a bloody semi-fluid mass. This, however, does not always hold true; the material may also be hard or cheesy. Upon microscopical examination may be seen blood cells, cells of the mucosa fecal matter, and numerous coccidial forms, especially the oocysts or resistant stage.

Controlling This Disease.

First occurrence on farm where poultry had not been kept for 10 years. Affected chicks eight weeks old shipped to Dr. Pickens at Ithaca, New York, who diagnosed it as Coccidiosis; further saying that the germ would live in the soil for four to five years. He stated isolation of the affected chicks and sanitation were the only possible means of control, and that in general, treatment was unsatisfactory and unsuccessful.

Following out this program I disinfected the houses daily, limed the yards, isolated the worst infected chicks "and on a hunch of my own" cut out all grain from the ration and fed only a moist, crumbly mash to which I added a medicinal poultry food. This secured fair results, but the mortality in one flock of chicks reached 50 per cent.

The same season and shortly after another flock became infected and under similar treatment the mortality reached 25 per cent. The following year the disease again occurred in a flock of 300 chicks and the mortality was 10 per cent. The next season there was not a recurrence of the disease, probably due to thorough sanitation. Cornell rations and methods of feeding were used during all this time.

Starting spring—April 28th, 1921—with 230 chicks in my back yard, I had a very illuminating experience as follows. At six weeks I had 223 vigorous chicks—then Zip! Coccidiosis! Loss 10 chicks, 4.4 per cent. Two of the birds were killed for examination by Prof. Dusham of the Zoology Department of Penn State. The microscopical examination showed the fecal material of these chicks to be filled with oocysts from the duodenum to the large intestine and especially in the caeca.

Nine of these chicks killed July 2nd showed the following condition: Digestive

hens in the show room. One should be able to look through the veneer and choose a woman who will always look good in whatever feather, who will always give you a little extra thrill as she goes about her daily tasks and a shock of delight when dressed for special occasions.

The reasons for my selecting the S. C. Black Minorca as my ideal of what a chicken should be may help some other brother who is as sea as to where to anchor in the harbor of satisfaction.

Historically, the breed is old, the first importations having been made into this country about forty years ago. The Standard established then has never been changed. Some unscrupulous individuals crossed them with Black Leghorns in order to supply the demand for eggs but with admission to the Standard of Perfection the characteristics of the S. C. Black Minorcas were established. This led, however, to the erroneous belief that the Black Minorca was originally a small fowl of the Leghorn type and that the present Standard has been developed from the smaller type. The Standard was made to fit the Minorca and not the Minorca to fit the Standard.

There is no bluff about the Minorca. Take three cockerels of the same age, Red, Wyandotte and Minorca, and raise them on the same rations until about six months old. The first two mentioned will look to weigh twice as much as the Minorca, but kill the three and dress them and you will get the surprise of your life. You will find that feathers, when off a bird, make a wonderful difference in the part of the fowl that is left for the table. I do not expect any prejudiced parties to agree with me but I am quite sure that from any point of view, the long, well balanced carcass of the Minorca would make you forget that you ever had a liking for any other table fowl.

Take several different pullets for comparison. Hatch them at the same time, give them the same care, put them in the laying house and watch results. The Wyandottes, Reds, Leghorns, lay little pullet eggs which one has to apologize for when offering for sale and which often bring less than standard eggs. Your Minorca pullets will lay eggs at the start that weigh the standard twenty-four ounces or more per dozen, and which increase in size as the pullet grows into the hen, until you have the standard Minorca egg weighing thirty to thirty-four ounces to the dozen. The Minorca will be profitable as a producer of large white eggs at three and four years of age. I have one I bought from a butcher five years ago, whose age I do not know, that still earns her keep and then some.

Your Minorca hen or pullet will lay through the year without losing from three to eight weeks in the "Bull Pen" or brooding a few chicks. Incubators have been doing this work successfully for many years.

The claim is made that a Rock or a Red for instance, will lay Winter eggs when eggs are high priced. I find by experience that a S. C. B. Minorca will lay just as many Winter eggs and many more Summer eggs. That they will produce about the same up to April and from then on I have to keep the "Bull Pen" in operation for the others but that the Minorca keeps right on into the Fall without interruption. Further that while the Winter eggs are higher priced, the production cost is also higher, so that in the long run the net profit is higher for the Minorca.

The Standard weight for the S. C. Black Minorcas are: Cock 9 pounds, cockerel 7 1/2 pounds, hen 7 1/2 pounds, pullet 6 1/2 pounds. These weights represent no excess feathers and the percentage of offal in dressing is exceptionally low. The feathers being carried close to the body give a graceful, rangy appearance and if you want to see poetry in motion just watch a flock of these black beauties chasing the elusive scratch grain in about a foot of good litter on a snappy morning.

My advice to any one who is about to engage in the poultry business for pleasure or profit, or to any one who is not getting the

results they have a right to expect from the birds they now have, is to study the history of the S. C. B. Minorcas and compare them with other breeds in the Standard of Perfection. You will find that from the utility standpoint or the standpoint of the fancier the S. C. B. Minorca is about as near the perfect type of fowl as it is possible to find. For the table you will find a beautiful, symmetrical carcass and in your egg basket you will find large numbers of the largest as well as the most beautiful white eggs produced by any breed in the Standard of Perfection.

Ohio, F. B. Huddleston.

Cost of Starting a Plant.

I have been reading with interest the letters written on this subject by Forster, Stillwagon and others.

It seems to me that there is too wide a difference in the opinions of these writers.

In the spring of 1921 I decided to go into the poultry business but knowing my limit I did not try to start the \$10,000 plant Mr. Forster speaks of, but bought an unimproved 7 acres near Kansas City. Being a jack leg carpenter, I built a four-room comfortable house, fenced the place with 5 ft. woven wire fence, with good hedge posts. Built a cheap poultry house 16x32, open front. I raised to maturity about 130 White Leghorn pullets from 40 hens purchased the fall before. This year I plan to enlarge the plant in the way of stock and buildings. I bought 2 small incubators last spring; also 2 coal burning brooders. Now as to the cost:

The outlay so far has cost me about \$3,000. I figured cockerels sold brought the pullets to maturity, but did not know just what my 130 pullets cost. If one were a Ford a Rockefeller he can spend \$10,000 as Mr. Forster suggested, to start his plant, but if he is a Stillwagon he can start in a small way for one-fourth that amount. No one ever jumped into the business very big and made a success of it anyway. I think the big ones always started small and grew big. I think there are more failures made in listening to alluring advertisements than ever were made by under estimating the cost of establishing a plant.

Mo. G. H. Wagner.

Toe Picking.

Toe picking is a habit that occasionally gets started in little chicks. It is a vicious habit and pretty hard to break. It sometimes starts with the little chicks getting mash on their toes and other chicks picking, it sometimes starts from lack of exercise, and it sometimes starts from chicks being put on litter and unable to see any bright feed or grit to pick at.

About the only solution to the problem is to give the chicks sufficient animal food in the form of milk or meat and give them plenty of range. As long as they are confined and find plenty of food close at hand they will be disposed to practice this vicious habit. Toe picking is a problem that has given many poultrymen a most discouraging thing to work with.

Early Crowing.

My neighbor H. G. Luiermore had a single comb Ancona cockerel four years ago begin crowing at 34 days from hatching, the same season I had a single comb Minorca do the same thing at 35 days.

In 1921 I had a setting of Rose Comb Brown Leghorns hatch the 10th of June and the earliest developing cockerel began crowing July 6th when 26 days old and weighing 7 ozs. Today he is one of the best developed birds I ever saw of his variety and apparently has as much vitality as two ordinary Leghorns.

N. Y.

—John Sherman

Color of Yolks.

Experiments at Missouri College of Agriculture, give the following results of various feeds on the color of the yolk of hen's eggs: Wheat gave 30 per cent. yellow, 12.5 per cent. orange, 67.5 white; maize, 70 per cent. yellow, 12.5 orange, 12.5 white; oats, 27.5 yellow, 2.5 green, and 72.5 per cent. white; with scrap meat the proportions were 20 per cent. yellow, 2.5 green, and 77.5 white; on green food, 72.5 per cent. yellow, 17.5 orange, and 10 per cent. white. Apart from the question of health, it is evident from these tests that green food is of great importance in the production of rich colored eggs.

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Kills Them All.—Not a Poison

Rats, Mice, Gophers—in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O., Checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 832, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.—Advertisement.

Poultry Without Lice

The U. S. Dept. of Agriculture in Bulletin No. 801, says in part:

"There is no fundamental reason why a flock should not be entirely freed from lice and maintained in this condition."

"The writers have tested a number of materials most generally advocated for lice destruction, and several new compounds which it was thought might be effective. In this series of tests nothing else was found to be as satisfactory as Sodium Fluorid."

Prove It Yourself

Wouldn't you be glad to get something which would rid your fowls of lice and keep them free from these pests all the time? Especially if it could be done for about ½ cent per fowl? It can. Ivo-San Sodium Fluorid will do it, and you can test it—prove it to your own satisfaction, we will send you a liberal sample, absolutely free and postpaid, also a copy of U. S. Bulletin 801 so that you can read what the Government says of this efficient method of getting rid of lice on poultry. Ivo-San Sodium Fluorid is also good for getting rid of ants and cock-roaches, and lice on live stock and plants. Write for free sample and Bulletin today—solve your lice problems.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

Plant apple trees this spring and fall. The following from Prof. Haskins of which applies to eight other states where apples can be produced:

It is stated that the apple orchards of Ohio have decreased by two and one half million trees since 1910. In view of the turn of affairs which has converted this country into a theoretical desert, this will be regarded as a calamity. And it is a calamity. That the great state of Ohio, one of the best apple states in the Union, should permit this great industry to go to decay and well nigh vanish is nothing less than a crime against the king of fruits. But there are evidences of a revival of the industry. Farmers are beginning to set out orchards of approved varieties, knowing that with the present shipping facilities good varieties of Ohio fruit always will command a good market price. And it will not be so very many years before every farm again will have its apple orchard. Its jars of delicious apple butter upon the pantry shelves and its barrel of ci-vinegar in the cellar, just as in the good old days when a cider mill was regarded as a necessary adjunct to every community and the big copper apple butter kettle indispensable to every home."

* * *

We have a small plot of ground, about 1½ acres, where we have a good sized vegetable garden. We want to set out six or eight apple trees. The soil is sandy loam, on which we grow good vegetables, without using much fertilizer. What varieties would you recommend for such a soil and for this climate, I had thought of McIntosh Red, Baldwin, Bellflower, Pippin, Delicious, Stayman Winesap and Starks Golden Delicious, but I think their Golden Delicious agreement absurd, don't you? What nursery would you recommend? Do you consider Stark Bros., Louisiana, Mo., reliable? Robert B. Colton, New Hampshire.

I advise you to plant two Delicious, two Golden Delicious, two Henry Clay and two wealthy. The Stayman Winesap is not adopted to your climate. I consider that the agreement demanded by Stark Bros. Nursery and Orchard company wholly fair and just. Stark Bros. Company has expended thousands of dollars in giving the wonderful Golden Delicious to the world. In this they have rendered a great service. Yes, Stark Bros. Company is reliable. They have been supplying planters not only in the United States but in all parts of the world with superior fruit trees and other nursery stock for 102 years.

* * *

I have a place 120x140 in Delaware County (14 miles from Philadelphia). I wish to raise R. I. Red utility stock.

1. What would be the best trees, apple, peach, pear, plum and cherry to plant for a continuous season of fruit?
2. Could I plant peach, pear, plum and cherry as a hedge in separate rows?
3. Are dwarf trees of other than pear a success?
4. Also are fruiting trees, 4 to 6 year size, successful?
5. Which is best for this locality, fall or spring planting?

Would thank you if you would answer these questions at your own earliest convenience. George W. Harris, Pennsylvania.

1. Apple trees: For a continuous supply of fruit from early to late, plant Henry Clay, Yellow Transparent, Wealthy, Delicious and Stayman.

Peach trees: Early Elfuta, Elfuta, Rochester, J. H. Hale, Krummel.

Pear trees: Lincoln, Seekel, Kieffer, Bartlett.

Plum trees: American, Surprise, Omaha, Wyant.

Cherry trees: Early Richmond and Montmorency.

2. It is not practical to plant apple, peach and cherry trees as a hedge. Dwarf pear trees make an ideal hedge and give an abundance of fruit.

3. Dwarf fruit trees, other than pear, are not advisable as a general proposition.

4. No. Do not plant such trees.

5. Fall planting is best for hardy trees in your locality.

* * *

Will you please advise me what apple and pear trees, also Red Raspberries to plant at Waterford, Ind? The place is located about 4 miles North East of Michigan City.

Illinois

R. G. Herbster.

For a commercial apple orchard I advise you to plant Delicious, Northern Spie and Grime's Golden. You will find the Lincoln and Seckle pear best for your planting. Cuthbert is the best for red raspberry. You should plant some Royal Purple raspberries. They will out-yield any other raspberry two to one. It is perfectly hardy in Indiana.

* * *

Would you tell me of any nurseryman that has strawberry-rhubarb. Also please advise me which kind of currants, gooseberries and grapes would be the best for me to grow in this part of Wisconsin? Wisconsin Harvey Tregoning.

The strawberry rhubarb can be purchased at any reliable nursery. It is a small, red stock and is not so sour as other rhubarb. Advise you to plant Lay and Red Crown currants and Oregon Champion Gooseberry.

* * *

Would you be so kind as to let me know which are the best market berries of the Strawberries, Black and Red Raspberries, and Currants. Would the Delicious and Golden Delicious apple thrive in this locality (Connecticut)? Would like to get the best berries for size and number that would stand shipping without losing their color or getting soft too easy?

Connecticut.

Joan E. Adams.

You will find the Dunlap, Haviland, Gibson and Sample strawberries wholly satisfactory. If you plant these varieties you will have berries from early till late. The Cumberland is the best black raspberry and the Cuthbert the best red variety. Plant also, some Royal Purple raspberries. This is the box filler. It is a good shipper, too. Fay and Red Crown currants are very productive of large fruit. The Delicious apple is perfectly hardy in your state.

* * *

I have 80 acres, sand loam soil, in Eau Claire Co., about 8 miles from the city of Eau Claire, which I wish to plant to apples and grapes, that is I will plant about 20 acres of same. Will this loam produce trees hardy enough to bear heavy yields or do you advise me to get heavier soil? Can trees be planted after stumps are extracted or year after? Would you be so kind as to let me know the most profitable apple trees to plant and likewise grapes? I am at present starting into chickens, on

a small scale. It appears there ought to be a good place for a hatchery. Can you tell me if there is any money in that enterprise and along what line it is best to run same? Also which of the large incubators you recommend.

Wisconsin. Ernest Johnson.

Sandy loam soil with clay sub-soil is ideal for fruit trees and small fruit, especially grapes and raspberries. Advise you to plant the Commercial apple orchard to Delicious, McIntosh Red, Senator and Northern Greening. The Concord is the most profitable commercial Grape. A hatchery properly conducted is profitable. There are several makers of large incubators that are wholly reliable. Consult the advertising columns of American Poultry Journal.

We are thinking of starting into the poultry business. We are farmers now. How is Liberal, Kans., or Kinsley, Kans., for a poultry plant? We are considering a custom hatchery. We want to start moderately and add to our plant. We want to consider feed and market. Also a place where a man could get work. Do you think the above named places would be any better than Las Animas, Colo., for a poultry plant? We are thinking of buying 5 of 10 acres and keeping a cow and perhaps keep a pig or two for meat. What do you think of this plan? Is it very deep to water in western Kansas? About how much would land cost reasonably close to town? When a family works 7 days a week and can't get all their work done or make expenses don't you think it is time to start over on a smaller scale? Mrs. E. L. Brown. Illinois.

Unless there is some important reason why you should locate in Western Kansas I advise you not to do so. You would be removed from the best markets. I advise you to locate in a section where crops are sure and where there is a large population, and where markets are at your door. As the head of your family desires to obtain employment, you should consider the advantage of locating near a manufacturing center. You will find that conducting a commercial hatchery will require the time and attention of Mr. Brown and yourself. The demands of a hatchery are very exacting.

Would like to know what varieties of cherries and plums would do good in a sandy soil? Also what variety of grapes? I have only a small place and intend to raise for home use only. Would Stark's Delicious and Golden Delicious be a good choice of apples. C. D. Humphrey. Illinois.

The Early Richmond and Montmorie are the best cherries. Omaha, Surprise and Terry are the best plums for your planting. If you plant Moore's Early, Niagara, Worden and Concord grapes you will have a supply of this fruit from early to late. Stark's Delicious and Golden Delicious will serve you well.

On a new field of strawberry plants set out last spring are small yellow worms that are rapidly destroying the plants. The worms are on the upper side and about the center of the leaf and the leaf rolls up enclosing the worms. Spraying with arsenate of lead has evidently not reached the worm as it has had no effect on them. If you have any information in the matter will you please advise me by what method or with what spray material these bugs can be destroyed. L. O. Audres. Iowa.

If you will spray the strawberry plants with "Black Leaf 40" you will destroy the bugs or worms. "Black Leaf 40" is the trade name for a nicotine preparation made by the Tobacco Products Co., Louisville, Ky. I would not, and could not

SAVE THE CHIX

From White Diarrhoea

with

Chol-Zen

A Medicine for Diarrhoea and Cholera
The Formula of Dr. B. F. Kaupp
Poultry Pathologist and Investigator, Author
of "The Anatomy of the Domestic Fowl"

Chol-Zen is a scientific medicine containing pure drugs to be absorbed in the blood to kill the germ of white-diarrhoea, cholera and common diarrhoea in chickens, ducks, and geese. Poultrymen everywhere recognizing the real need of a reliable remedy that they can depend upon will welcome this announcement that a medicine containing the right drugs and given in correct dosage as developed by Dr. Kaupp through his extensive research, study and experiments, with these diseases, can now be obtained.

Dr. Kaupp has chosen the Zenner Products Company (Manufacturers of Zenoleum, the coal-tar disinfectant) to produce and market his scientific preparations for the treatment of poultry, and we give positive assurance of highly satisfactory results with their use.

Chol-Zen is put up in tablet form. Each tablet is machine-sealed in a separate air-tight and moisture-proof compartment, and never exposed until used. This assures the maintenance of full quality of each and every tablet. Impurities cannot reach it. Moisture cannot break it down, nor can rubbing by contact with other tablets result in crumbling. This is a guarantee of full strength of medication and against waste of broken tablets. Price 100 tablets \$1.00 post paid.

Special FREE Offer

For a limited time to quickly introduce this and other preparations of Dr. Kaupp to poultry folks, we will include with every \$2.00 order for Chol-Zen one full size \$1.00 carton of ZENNERGY—Dr. Kaupp's famous tonic for laying hens—a product dependable to produce more eggs without injury to the hen.

Both products—2 full size packages—200 Tablets of Chol-Zen \$2.00 and one full size \$1.00 package of 100 Tablets of Zennergy FREE. Your money back if the trial does not convince you. Send your order today.

Open Air Poultry Houses

By Dr. Prince T. Wood. Tells plainly and in detail just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by the most successful breeders. The best and most practical work on the subject. 48 illustrations of poultry houses, plans and diagrams, and photographs of construction work. Shows how to care for your houses and fowls to get better poultry, greater egg yield and fertility and freedom from disease. Price 75c, postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

Why Poultry Pays and How to Make It Pay

An entirely new book and different from our old book of similar name. Tells you how to raise poultry from the "money-making" point of view; gives the beginner sound advice about starting in, tells the approximate cost of land, buildings and fowls necessary to start a market poultry plant, and also gives valuable suggestions on the Winter egg question. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

999 Questions and Answers

By Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information in a few words, and right to the point. Contains such subjects as the fancier, eggs, feeding, correct rearing of chicks, what and how to build, natural and artificial incubation and brooding turkeys, ducks, and geese. Price, 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

afford to be without this valuable spray material.

* * *

Would like a little information as to what you think of hollow tile for the building of a poultry house? Some men that I have talked to about it think it would be damp in winter caused by the warmth and breath from the chickens. What is the best fall apple for my planting?

E. J. Pickerel.

South Dakota.

A poultry house properly built of hollow tile is very desirable, and has none of the objectionable features you mention. The best fall apple for your section is the Wealthy.

* * *

I am starting in the poultry business. Have White Leghorns. The location is 100 miles south of Louisville. The local market is very unsatisfactory. Can you suggest where I can find a market for strictly fresh eggs, also broilers? In early spring I have about a case of eggs a week to dispose of. Is it practical to sell and ship eggs by parcel post? How would I secure my customers? Would like your advice as to some good books for the beginner in poultry raising to read. Can a plant plum trees in poultry yards? Will spraying the trees endanger the life of the fowls?

Kentucky.

Clara A. Crabb.

You can ship your eggs to the nearest large city. With only a case of eggs per week you should be able to profitably market them in private homes. Yes, it is safe to ship eggs by parcel post. Write the American Poultry Journal for a list of poultry books they publish and have for sale. Subscribe for a number of Poultry Journals. Plum trees do well in poultry yards and give shade for the fowls. Spraying the trees will not endanger the life of the fowls.

"Of Two Evils, Choose the Lesser."

By A. F. Rolf.

The Wise Man who first propounded the maxim which constitutes the title to this plea, must have experienced conditions similar to those now facing the American poultry industry.

And, believing that there are other old adages which have proven their fundamental truths, and which carry sermons which might well be considered by the poultry breeder of today, the writer begs your indulgence while presenting a few of them.

"As You Make Your Bed, So You Must Lie In It."

For a few months more than fifty years, the American Poultry Association has been making its bed. From the great noises which are now arising in many quarters, one would almost think that the breeders considered it made, and not liking its structure, there is talk of starting to build another. But, the thought comes as to whether it is necessary to discard all that has been done before we are able to earn the restful reward of a bed well made.

"Continue Adding Little to Little and You'll Form a Great Heap."

The continual adding to the humble beginning will eventually result in a substantial accumulation, but to discard the results of past work would mean beginning all over to attain the desired end, with no assurance that it would not be discarded before forming the "great heap." True, we have made mistakes, but why not add the necessary corrective measures to our present "heap" and attain the object of our endeavors that much more quickly.

"Disputations Leave Truth in the Middle, and the Parties at Both Ends."

"United we stand; divided we're stuck," and if we continue destructive disputations and bickerings, we are bound to find ourselves divided into two parties, situated at

Secrets of Expert Exhibitors and Easy Lessons in Judging

By FRANK HECK

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider the immense advantage you would have in being able to detect faking.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes. Don't put off sending your order. You need the book NOW. The price of the book is, including postage, \$2.00.

American Poultry Journal

523 Plymouth Court Chicago, Illinois

the ends instead of on a common, middle ground of truth.

"Every Woman Can Keep House Better Than Her Mother, Until She Tries."

It is easy to criticize; constructive criticism is always permissible and desirable, but criticism that does not set forth some solution to the difficulties is both destructive and undesirable. Whether a new organization could "keep house" any better than the mother—the American Poultry Association—is a question which should have serious consideration before any steps are taken in that direction.

"Experience Keeps a Dear School, But Fools Will Learn in no Other."

We do not believe that poultrymen, on the average, are "fools" and that they will have to be taught the disastrous lesson which is bound to accompany dissension, and divided effort, through an experience that will destroy many of the benefits which have already accrued from the conscientious efforts of generations of constructive poultry development.

"He Who Shows His Passion, Tells the Enemy Where to Hit."

Many good men have been led astray in the heat of passion. If the poultry industry is to avoid a blow from which it will be a long time recovering, we must restrain passion, and study the solution of our problems with cool, calm, serious consideration.

"No Smoke Without Some Fire."

The smoke of criticism which has beclouded the American Poultry Association during recent times, surely indicates that there is a fire which must be quenched by application of proper methods of operation which will extinguish the present weaknesses. We are not in the position of an open prairie, where the only hope of controlling the fires is through setting backfires which may, themselves, become uncontrollable. We are, rather, a structure which must be saved by direct action at the source of the trouble.

"Opportunity Must Be Seized by the Forelock; Behind She Is Bald."

The bald past offers little, except the lessons which have been taught by our mistakes, but our opportunity lies just ahead. And that opportunity to perpetuate the great accomplishments of the American Poultry Association—and they are great, when viewed from an unbiased standpoint—may be achieved by a safe, sane, re-organization of the association, if the members vote for the proposed amendment aimed in that direction, and the President selects a competent body to do the work. The writer has not always agreed with the official policy and action of the present administration, but he has confidence in the integrity, and the determination of President Rigg to do what is for the best good of the industry, so feel sure that he will do his utmost to obtain such a committee.

"Prove All Things; Hold Fast to That Which Is Good."

The American Poultry Association, in spite of its mistakes and shortcomings, has proven its worth by accomplishing much good, and we should hold fast to those attainments as a basis for accomplishing still greater benefits.

"Public Good Must Be Preferred to Private Advantage."

It is with a feeling of great apprehension that the announcement in the May issue of the American Poultry Journal, relative to the proposal of the Allied Show Secretaries of America planning to publish another Standard, was just read. This may sound inconsistent in view of the popular impression which went abroad relative to the standard activities of the National S. C. White Leghorn Club, but the writer hastens to assure all breeders that the purpose of the Club has never been, and never will be,

JUNE CHICKS!

EGG BASKET MAID, a Record Layer

At Reduced Prices

15,000 Egg-Bred Chicks Weekly

Double Your Poultry Profits with our famous

EGG BASKET STRAIN

of English 250 Egg Strain S. C. White Leghorns. Thirty years of careful breeding for heavy egg production, large size, and beauty makes them far superior to ordinary Leghorns. They are the long, deep-bodied typical birds with large lopped combs. Foundation stock imported from Tom Barron direct. Purchase our day old chick of quality and be one of the thousands of our satisfied customers making great profits like Mr. D. J. Powell who writes: "The pullets we raised from your May chicks gave 60 per cent egg yield in December and January and 70 per cent in February and are now laying at the rate of 80 per cent and better." We have hundreds of similar letters. We are constant winners of hundreds of prizes at leading EGG LAYING CONTESTS and Poultry Shows. Send for our large illustrated catalog, worth many dollars to you and tells about our winnings, testimonials, and shows our large plant with its thousands of layers. EGG FARMING FOR PROFIT fully explained. Write for it—it's FREE.

PRICES ON OUR EGG BASKET STRAIN CHICKS FOR DELIVERY AFTER MAY 15

Grade A.—Chicks are from selected hens direct descendants of pedigreed stock. Hens are typetested, selected for large size, beauty, and are high record layers mated with pedigreed sires of high record dams. These are very high quality chicks. Prices, \$18 per 100 or \$17 in 500 lots.

Grade B.—Utility matings are high grade selected females. They are long, deep bodied birds with large lopped combs, mated with excellent males, direct descendants from our pedigreed stock. Prices, \$13 per 100 or \$12 in 500 lots.

Keep Your Chicks Alive

Others are doing it, so can you. Don't let the chicks die like drowned rats with White Diarrhea and other diseases—give them WACKER'S CHICK TABLETS in the water from the start, then you'll see them grow. Others will wonder how you do it.

Better Than Green Food

Just dissolve WACKER'S B. T. G. F. Tablets in the drinking water, you get better results, larger eggs and better production; ask any one that uses them. No meat then needed. Try Wacker's Roup Tablets, they will not fail you. WACKER'S TABLETS MUST PRODUCE RESULTS OR YOUR MONEY BACK. C. O. D. orders promptly filled. All tablets, 600 for \$1; 1300 for \$2.

Wacker Remedy Co., Box 157-22 Camden, N. J.

Revolution in Egg Production

By George C. Newell. Read this book and learn how you can lengthen the hen's working day in Winter by the use of lights in the hen house when the egg yield is lowest. It shows that by these new principles you can increase the Winter egg yield 100%. This is not a theory, but a book written from the personal experience of the author. Cloth bound. \$1.00 postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

to set up a standard in opposition to that of the American Poultry Association so long as that body shows a willingness to make their standard conform to the best interests of the breed, as determined by the actual, constructive breeders of the breed in question.

We feel that competitive action at this time is not well taken. If it should so happen that the American Poultry Association should attempt to promulgate a revision of the Standard which was in opposition to the desires of the real breeders, then there would be good ground for such action. And, in such event, the writer would lend his every effort toward combating their attempts to thwart the men in whose hands the breeds rest. But, such action is inconceivable, under present conditions. We have faith in the intention of the constituent parts of the American Poultry Association to cast aside any private advantage, and to work together for the public good of the poultry industry.

"Quarrels Would Not Last So Long, If the Fault Lay All on One Side."

Even as the maxim sets forth, we can see that the faults are not all on one side. Many have been unduly influenced by radicals who have often swept previous conventions "off their feet," and carried their points by sheer impassioned, oratorical appeals to passion, sentiment and prejudice. Today, however, the vast army of poultry-

"We Shall See," As the Blind Man Said."

Yes—we too, shall see. If the breeders will make a real effort to attend the Knoxville meeting of the American Poultry Association, they will have an opportunity of making history—of achieving their own desires. But, if they set back and "Let George do it," there is doubt about its being done right, and we may be forced into action which will cause a real upheaval in the poultry world.

This plea may be couched in language which differs from the usual tendency, but it is the earnest hope of the writer that it may carry its intended message deep into the hearts of the intelligent breeders, and may aid in effecting a stronger determination for harmonious, concerted, practical action along safe and sane lines.

"You will go safely in the middle of the road," runs another truthful maxim. Let us stick to the safe path.

PRESERVING EGGS.

The practice of preserving eggs during the period when they are plentiful in the spring is a policy that will pay all users of eggs.

For the small producer water glass is generally considered to be most convenient, and it does not affect the flavor as lime water is apt to do. Water glass is sold by druggists.

A pint of water glass (silicate of soda) should be dissolved in ten pints of boiling water. Stir the solution thoroughly and then let stand until it is cold.

Eggs may then be put into the preservative, and the most suitable containers are enamel or earthenware vessels. If a few eggs are put in each day, add preservative so that they are covered to the depth of two or three inches.

An inverted saucer or plate laid upon the eggs will prevent them from floating, and when the vessel is filled it should be sealed and stored in a cool place, such as a cellar, or the coolest place in the house if there is no cellar.

Rose Bugs Poisonous to Chicks.

The rose bug, reddish brown in color and about one-third of an inch long, is poisonous to young chicks; and when these rose choppers are eaten in sufficient numbers they are liable to kill the growing chickens. The younger the chicks, the greater the danger. Ten weeks old chicks are practically safe. The poultryman must rely upon methods of keeping the bugs and the chicks apart.

In many cases it does not pay to feed Leghorn cockerels after they reach three pounds to the pair, if the purpose is to produce poultry for market. If the birds are few in number and on range, they can be grown cheaply, but if all the feed must be purchased, utility Leghorn cockerels should go to market as broilers.

Get More Eggs With Dr. B. F. Kaupp's Tonic for Laying Hens Zennergy

"Only Healthy Hens are Laying Hens"

Every poultryman will welcome the announcement that a thoroughly reliable poultry tonic can now be obtained—a tonic compounded of pure drugs and designed to make good the several deficiencies of poultry feed and digestive stimulants. Sanitation, good feeding and culling are important to increase the egg production. After this comes "ZENNERGY"—a stimulating, health-building tonic scientifically prepared in proper dosage and made of ingredients to stimulate the reproductive organs and the appetite, by increasing the flow of gastric juices and aiding digestion. It's a nerve stimulant—a stimulant to eliminative organs—a completely rounded out preparation of certain benefit to all fowl.

Dr. Kaupp has chosen the ZENNER PRODUCTS CO.—Manufacturers of ZENOLEUM, the famous coal-tar disinfectant—to produce and market his scientific preparations for the health building of poultry, and we positively guarantee satisfactory results with their use.

ZENNERGY is put up in tablet form. Each tablet is machine-sealed in a separate air-tight and moisture-proof compartment, and never exposed until used. This assures the maintenance of full quality of each and every tablet. Impurities cannot reach it. Moisture cannot break it down, nor can rubbing with contact with other tablets result in crumbling. This is a guarantee of full strength of medication and against waste of broken tablets. Price 100 tablets \$1.00 post paid.

Special FREE Offer

For a limited time to quickly introduce "ZENNERGY" and other scientific preparations of Dr. Kaupp to poultry folks everywhere, we will include with every \$2.00 order for "ZENNERGY" one full size \$1.00 carton of CHOL-ZEN—Dr. Kaupp's medicine for diarrhoea and cholera. Both products—two full-size packages—200 tablets of "ZENNERGY" and one full-size \$1.00 package of CHOL-ZEN free. Your money back after trial, if you desire it. Send your order today.

League of Poultry Shows.

We acknowledge with appreciation the many letters received congratulating us on our stand as regards the breeds that have not been recommended for admission to the Standard of Perfection by the Revision Board.

We wish to state that we do not intend to make standards and we sincerely trust that we will not be forced to publish any, but we do emphatically state that any breed or variety that has a goodly sized club and a standard that is copyrighted and endorsed by at least 75 per cent. of its membership, and this breed or variety has been shown at one or all of our shows in sufficient numbers and quality, we will issue the standard in a book which we will call "The Ideal Chicken" and designate it our "Standard For Judging."

We fully realize that there should be one standard for judging exhibition poultry, and if our plans crystallize as we intend, there will be only one; but we give warning to all that we will protect our patrons who help to maintain the great hub of the poultry wheel:—namely, Standard Exhibition Poultry Shows.

If, in our enthusiastic honesty, we have not made ourselves clear in statements we have sent out, or otherwise, some having gotten the idea that we are going to issue standards, regardless; we are sorry. Our business in the main will be for the guidance of poultry shows. (If found necessary we will publish and not make standards). We will see to it, as near as humans can, that our judges shall judge by the acknowledged written Standard, preferably the one printed by the American Poultry Association. But one, will be designated. If the A. P. A. does not furnish one, we will get the clubs to do so.

Another part of our program is to protect each other. For instance, exhibitor's entry fee checks going to protest and the exhibitor not making good. These exhibitors will not be able to show at any of our shows. Some poultry journals are delinquent in paying for booth space; these will be barred from our shows. Some poultry and other journals are not particular as to the representatives they send to poultry shows, these will be asked to leave if objectionable and what money paid will be forfeited. We will be the judge as to whether the salesman is conducting himself and his business properly.

Exhibitors who become obnoxious will not be allowed to exhibit at any of our shows. If any judge has any fault to find with another's judging he may be required to report to the secretary, possibly in writing. Poultry shows that do not live up to their rules and regulations; who do not pay all premiums, ribbons, etc., will be suspended until such times as they present a clean bill of health. Any judge who officiates at a suspended show will be barred from any other show in the League, the same rule applying also to exhibitors.

We will recognize only one show in a City.

We hope in time to have a set of by-laws and classifications for poultry the same for all shows, differing only as to entry fee and premiums.

The field is so large that it is impossible to state all our desires at once, but as time goes on, new and advanced rules will be tried out, adopted or discarded; and let it be understood that our aims and ambitions are to advance to a higher plain for the benefit of the breeder and sportsman. All who have the desire for better poultry shows, we ask your help.

We stand for right, ready to condemn and suspend all who practice wrong, or other than that which is the conduct of a sportsman and a gentleman.

N. J. Harry W. Britton, Secretary.

Correction.

"Brother Bob," the Buff Leghorn cock referred to on page 592 of the May issue, won at Milwaukee. The printer made it appear that the cockerel had won 1st. First on Buff Leghorn cockerel at the last Milwaukee show, was won by Frank Kemp, Wisconsin. "Brother Bob" won at Milwaukee some two years ago and is sire of the cockerel illustrated on page 593.

Vent gleet is a venereal disease, characterized by offensive odor and yellowish matter around the vent. A female which has this disease should be isolated from the flock. If she remains in the pen the disease may be communicated to the entire flock by the male.

600 Pages, 340 Illustrations and Plans, Fully Indexed, Cloth Bound

WANTED FREAK ANIMALS and birds. Apply Browning Amusement Co., Riverview Park, Chicago, Ill. 6-11

Pen drawing (exact line reproduction from actual photograph) of one of Oak Dale's first prize Madison Square Garden winners.

What a Leghorn! What a price!

50%

Order now. Take advantage of this summer sale. Take your choice of thousands of 8 to 10 weeks old pullets sired by great breeding males. Deliveries made during June and July. Make your own selections from 100 show hens and exhibition cocks which are now offered at practically half-price for 60 days only!

Reduction Summer Sale for 60 Days Only

The owners of Oak Dale Farm propose to hold Oak Dale in the lead as the world's greatest White Leghorn foundation stud. They further propose to take the lead in value-giving. When they secured the services of Harry M. Lamon to personally supervise Oak Dale they knew they need go no further to guarantee 100% square deal to the Leghorn fraternity.

"The character of a good man inspires faith in him. The standard set by such a man is an inspiration to all who know him. As knowledge of him increases, his circle of influence widens and benefits to others multiply."

The owners of Oak Dale Farm are business men. They place the destiny of Oak Dale in the hands of the greatest Leghorn-man they could find in a nation-wide search. If Oak Dale was a plant-breeding farm, no one but Burbank, "the plant wizard," would do.

But Oak Dale is a White Leghorn breeding stud.

There was only one choice—Lamon himself—Lamon, "the master breeder."

The owners of Oak Dale offer you three things.

1. Blood—unquestionably the world's greatest!
2. Individuality—New York, Madison Square Garden quality!
3. Value—Every shipment personally selected by Lamon!

During June and July we offer you mature breeding stock, partly grown pullets, and about 100 show hens and exhibition cocks (birds you can now buy cheap, molt out and win on later) at approximately 50 per cent of their real value. These mature birds are in our stud pens. In order to break up our breeding pens and allow every developing and mature bird wide range over broad-acre clover fields and virgin woods we are offering these birds at reduced prices for 60 days only. This is your chance to get something choice at a very reasonable price. Trade in the summer is always slack and these offers are made merely to keep "the wheels turning" and retain all of our help on the year round basis. Details of the above sale of stock are as follows:

Breeding Hens: Less than 60 offered; sired by the star breeding males that have been used on Oak Dale. These royally-bred females will pay for themselves in the chicks you can raise from them in one season. If you own a proven sire, get one of these hens, mate her next season, pedigree her chicks—and be convinced.

Yearling Hens: Full sisters and close blood relatives to above. Next

January they will be worth twice what they will cost you now.

1922 Pullets: Thousands of spring hatched pullets that are growing more valuable every day. Develop them yourself.

Baby Pullets: Some will develop into stars later on.

Breeding Males: Order one, pedigree the chicks he sires next spring. Order now at reduced prices. We need room.

Yearling Cocks. Take your choice of 125 cockerels hatched in 1921, and held over to make cock birds. Need room, short of special individual molting yards.

1922 Cockerels: Youngsters (sired by magnificent sires) that promise at this date to develop into the greatest lot ever bred on Oak Dale. Someone is going to win the big shows with them next winter.

Baby Cockerels: Full brothers to above star cockerels, but hatched later.

Eggs: All \$20 settings now \$10; \$15 settings now \$7.50; \$10 settings now \$5.00; \$7.50 settings now \$3.75; 100 eggs from our General Flock now \$10. Orders filled in rotation as received. Last chance. Every shipment, stock or eggs, will be selected by Mr. Lamon. Write him in detail. Explain what you need. He will help you if he can—and if he can't he will honestly tell you so. Deal with Mr. Lamon direct—if you know him, you know he will do his level best to help you. A 100 per cent. square deal guaranteed. You, as the buyer, to be the judge. No breeding establishment can offer you more.

Oak Dale Farm, Box A, Le Roy, Minn.

Harry M. Lamon, Manager

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World

Raise Your Chicks

The FUL-O-PEP Way

This is the season when young birds should be growing and developing **FAST**. They will if you feed them the Ful-O-Pep Way. Keep the Ful-O-Pep Growing Mash feeder full all the time—let the birds have all they want — also supplement the Ful-O-Pep Growing Mash with FUL-O-PEP Coarse (intermediate) Chick Feed after birds are 4 weeks old and you will get more pounds of gain for pounds of feed used than can be obtained with any other method of feeding.

The Ful-O-Pep Way of feeding growing birds develops big healthy stock and pushes the young pullets along, so that they begin to lay early. Many of our patrons report that their young pullets raised the Ful-O-Pep Way, begin laying at a remarkable early age. Here's what some of our patrons say about the Ful-O-Pep Way:

The Quaker Oats Co.,

Gentlemen: Knowing that you would be interested in the results I have had in feeding Ful-O-Pep Feeds which I have used exclusively this season, I am glad to say that in raising my pullets the Ful-O-Pep Way practically 90 per cent were laying before they were 5½ months old which is truly a remarkable record. Wishing you continued success with these feeds, I am

Yours very truly,

H. N. Cooledge.

Atlanta, Ga.

The Quaker Oats Co.,

Gentlemen: It is only fair to you I think, to write and tell you the success I have had with your Ful-O-Pep Feeds. I have followed your directions as closely as possible and Oh, my, the results. I never saw chicks grow so fast in my life. Ful-O-Pep Growing Mash is sure the proper feed. Out of 369 chicks I have only lost nine. Anyone can have the same success I am having if they will only follow the Ful-O-Pep Way. Ful-O-Pep is the word.

Yours very truly,

W. L. Mitchell.

Mannington, W. Va.

The Quaker Oats Co.,

Gentlemen: You will probably be interested to know that I began feeding Ful-O-Pep Feeds to our first pen of pullets which were hatched on the 12th of March and are now, Sept. 16th, laying better than 52 per cent. They are fine birds—the first ones this year laying just 3 months and 18 days from date of hatch. We hatched over 22,000 chicks this year and recommend Ful-O-Pep Feeds to any customers who asked about feeds, feeling sure they could raise their chicks much easier the Ful-O-Pep Way than by any other method.

Yours very truly,

Hilltop Farm, H. W. Lambert, Poultryman.

Suffield, Conn., Sept. 21, 1921

And so it goes, everywhere chicks are grown, everywhere Ful-O-Pep Feeds are used—come reports telling of the **better results** obtained by following the Ful-O-Pep Way. If you are not feeding your chicks the Ful-O-Pep Way now, by all means give it a trial, the results will be surprising to you. Your dealer can supply you.

Have Early Laying Pullets Next Fall

Great Annual Surplus Stock SUMMER BARGAIN SALE

of World Famous Holterman "ARISTOCRAT" Barred Plymouth Rock Prize Winning Stock

My long-established Summer Bargain Sale of Producing parents of Prize Winners starts this year on June 1, and continues only until my last surplus "Aristocrat" breeding bird is gone. Each year the fame of this Holterman Bargain Sale at unbelievably low prices has continued to spread and this year will no doubt see these scores of powerful producing birds entirely disposed of in a very few weeks. Remember, that every bird represents a standard, fixed value, given to you at a tremendous discount from my normal prices.

READ MY GUARANTEE On THIS Stock

I hereby guarantee that each specimen in this sale is worth the full catalog price and that I obtain the regular catalog price for such stock during the balance of the season. I also guarantee that each specimen will suit the purchaser in every way, shape and form. If for any reason the purchaser is dissatisfied, the birds may simply be returned in good condition after a rest of three days and I will then gladly refund the entire purchase price. This broad guarantee surely protects you fully. You may well rest assured that under these conditions I will send you birds so rich in quality for the price that they will be far beyond your just expectations.

(Signed): W. D. HOLTERMAN.

cers and put it in folder form. You may read all the facts in their proper relation and study all the prices and amazing savings at one and the same time. Get this information now—it does not in any way obligate you, and it will help you to make your selection before my entire stock is gone.

Coupon Brings You FULL Details, Descriptions and Prices—Mail It Now

REMEMBER THIS—20 to 40 per cent. discount from the regular catalog price of every bird listed; every bird guaranteed fully by me as above; and not one penny risked by you. Send the coupon now!

Ft. Wayne, Ind., U.S.A.

You Actually Save 20-40% Off AND BELOW MY CATALOG PRICES

The name "Holterman" bears an international reputation as a breeder of world winning Barred Plymouth Rocks, painstakingly developed by my own methods and resulting in birds of supreme excellence, known to the world as my "Aristocrat" strain. They are unquestionably the biggest profit-producing birds ever bred. The very greatest of all my "Aristocrats" I use for producers—for the production of chicks that become equal and better than their parents. And each year I replace some of these famous parents with the very best of their own wonderful offspring. This gives other breeders the yearly privilege of getting some of these great producers of Prize Winning and Record Laying stock, while I, in turn, advance the quality of my breeding flock with young birds of my own thoroughgoing selection.

Why These Astonishing Bargains Are Grasped So Quickly!

See my guarantee above! Remember, my great offer has been snapped up each year, again and again, by the same people. Then remember my huge file of letters from breeders the country over who state, over their signatures, that my values at bargain prices are not equalled anywhere in the poultry business! For your benefit I have outlined every fact regarding this Great Summer Bargain Sale of "Aristocrat" Famous Producing Parents.

BYERS' ORPINGTONS

Supreme Quality Buffs, Whites and Blacks

76 of my Orpingtons have stood First at great Chicago Coliseum Shows the past 42 months. ADULT STOCK NOW HALF PRICE. \$25.00, \$50.00 and \$100.00 Males and \$50.00, \$100.00 and \$250.00 Pens (4 Females and Male) will be sold this month at just half these regular winter prices. Engage these double values quick for your District, Provincial or State Fair Winners and model breeders next season.

C. S. BYERS *Orpington Specialist for 21 Years* **HAZELRIGG, IND.**

NOTE—You have followed my advertising in this Journal during the past winter. The sterling merits of my Strain have constantly been unfolded to you in this leading publication covering a period of many years. Through correct methods and the delivery of maximum values I have gained the confidence of thousands of the leading Orpington breeders throughout America. This priceless confidence will be maintained and the double values announced in this advertisement will be delivered.

C. S. BYERS.

The Wishbone Makes most Money because the Wishbone Saves most Money

IF you own a Wishbone, you cut your expenses—and your profits leap ahead. You save fuel and time and space. You hatch better chicks, a higher percentage of livable chicks. Your cost per chick is absolutely the lowest possible.

You **MAKE** most because the Wishbone Mammoth is scientifically constructed to **SAVE** most. The Wishbone patented devices reduce labor to a minimum. You don't have to touch the eggs from the minute you put them into the Wishbone until the chicks are hatched. You are absolutely certain you are hatching your chicks at the lowest possible cost.

The Wishbone patented heater, by using **ALL** the combustible gases, cuts your fuel bill in half. Wishbone three deck construction saves most space. Ask us to prove this.

Start next season with a Wishbone. Be sure of big profits. Get into the class with the largest, most successful hatcheries in the country. Find out about the Wishbone now. **SEND FOR THE WISHBONE CATALOGUE.** Read about the many exclusive Wishbone patents that eliminate the troublesome work-wasters and time-wasters of hatching.

The Wishbone is as perfectly constructed as a fine watch. Let us tell you all about it.

The perfected machine offered by the inventor who made the modern mammoth possible.

Owen Farms

Stand Pre-eminent As A Breeding Establishment

For seventeen years Owen Farms birds have been shipped all over this continent and abroad. They have become the foundation of innumerable successful flocks all over the world. Wherever they have gone they have made friends not only because of their superior Standard quality but because they have proved unequalled as layers and as prepotent breeders. Owen Farms Reds and Buffs "Lay, Weigh and pay." There is no flock in existence so strong that it cannot be improved by the rich producing bloodlines of Owen Farms.

S. C. RHODE ISLAND REDS and BUFF ORPINGTONS

They have proved their superiority by winning the highest honors in thousands of show-rooms all over the world; by making exceptional egg records in public contests in the trap-nests of customers; and by becoming the prepotent sires and dams of strong virile flocks that have made their owners successful.

Now Is Your Opportunity

to secure foundation birds from this unequalled flock. Tested breeders for 50 per cent of their value prior to the breeding season. Am making room for my thousands of growing youngsters and you can carry over for next season's breeders one or more carefully mated pens that will give you superb quality at a low cost. Yearlings, or two-year-olds, as you please.

S. C. Rhode Island Reds

- 5 Pens of five birds @ \$ 75.00 each
or nine birds for \$100.00

Remember—The above birds are genuine quality breeders that are offered you for a fraction of their real worth. Order directly from this ad and make sure of your pen for 1923 breeding. The writer will personally select and mate your pen for you.

1922 YOUNGSTERS

are rapidly rounding into shape. Superb January hatch cockerels and pullets to win your early fairs. Strong, sturdy January cockerels to head your early matings. Line-bred quality birds that will prove profitable investments. A few early moulting cocks and hens for your fall fairs to fill out your string. Let me know exactly what you need.

Owen Farms Service

For twenty-four years all my time has been devoted to producing the best in Standard-bred poultry. The past seventeen years have been here as manager and then owner of Owen Farms. What I have learned during this long period is at the disposal of Owen Farms' customers. Let me help you solve your problems. Come and visit Owen Farms. You will never regret the time it will take nor the expense involved. If you cannot make the trip, come on paper. Write me fully and frankly. My reply will be exactly what it would be were you beside me at my desk. "Once an Owen Farms' customer, always a customer of Owen Farms," has become a truism. You can learn for yourself the reason why.

SUMMER CARE OF GROWING STOCK

SOME people complain of poor results with purchased eggs, and refer to good success with their own eggs. Not uncommonly they have fussed too much with the eggs or chicks for which they paid a good price.

Some people have trouble with partly grown chickens. The trouble is often due to tight coops. Lack of ventilation, with accumulated droppings giving off odors, ruin many broods of chicks. The little birdies need out-door air, and need more and more of it as the weather gets hotter and their bodies grow larger.

Bad ground, contaminates and spoils many lots of chicks. If you haven't growing runs covered with green grass, then plant oats in your runs. You cannot grow good chickens in old chicken runs—and a chicken run is old as soon as it is bare.

Open sheds for the out-door air to enter and green runs to avoid ground contamination are two major factors.

The next two things are full feeding and roomy quarters. Do not keep more growing youngsters than you can send to roost every night with crops full to over-flowing.

Do not keep more growing chickens in a coop than can spread out comfortably and have plenty of room.

It may be different with utility stock, but if you are growing Standard exhibition birds, remember that the best bred chick in the world can be grown out into a cull.

In Golden Wyandottes, lice may cause purple barring in the black feathers of the tail. Crowding, underfeeding, lack of ventilation, or contaminated ground, may cause white feathers in the wings, although black and red ones would naturally have grown.

The Future Winners.

From the time the chick first kicks out of the shell until it is in the show room eternal vigilance must be the watchword. Let it stop growing even for a few days and the chances of its maturing into a winner are that much reduced.

The proper time to begin to raise the chick is six months before that chick emerges from the shell. Too fat or too thin breeders, lack of vitality, improper feeding of the breeding hens and kindred evils must be corrected before we can hope to produce chicks that will develop into winners.

Small matings are invariably the rule where the finest birds are produced. The beginner is apt to mate his best male with fifteen or twenty hens so that a large number of chicks may be raised. The old fancier will use three or four of his best females with the choicest male. With these small matings the condition of each bird can be seen at a glance and if the male is not getting enough to eat

By **MELVIN F. UPHOFF**

Four factors are of major importance — Fresh ground — Ventilation—Full feeding—Good Roomy houses.

he can be separated each day for a few minutes to eat by himself.

Why do a large number of prominent fanciers still stick to hen hatched and hen raised chicks? Largely, I think, because men who can really operate an incubator and properly brood chicks by artificial means, are few and far between. Let the tem-

perature run up to 110° for a few hours the second week. The hatch may be good but few birds from the lot will ever see a show room. Chicks in a brooder must be watched night and day, especially early in the season. While caring for several thousand pedigreed chicks, I made a practice to look at every brooder stove and every lot of chicks between 12 and 1 o'clock at night and 5:30 in the morning. Too much trouble? You won't think so when the ribbons adorn your coops.

There are a number of very good chick "starters" on the market which will give excellent results. Nothing is better for the first few days than hard boiled eggs mixed with a good buttermilk starting food. Where an exceptionally choice lot of chicks are being fed I continue feed-hard boiled eggs until they are three weeks old, even if the eggs must be purchased at market prices. There are very few good chick scratch feeds on the market today. Cracked wheat, steel cut oats and cracked corn form the best combination of chick grains. Beware of the bright looking chick feed loaded with indigestible seeds. Chick scratch should be given when they are a week old—little and often.

After six or eight weeks a growing scratch and a growing mash may be substituted for the chick starter and chick scratch. It is more important how the feed is given than the feed itself. Overfeeding one day and underfeeding the next day will never produce the winners. They must be watched closely and only what they will clean up quickly should be fed. An examination of the crops of the birds after they have "turned in" for the night will prove the best guide for feeding.

Changing Plumage.

The fancier never grows tired of watching the youngsters change from one coat of feathers to the next. First we have the little downy chick which quickly sprouts wing feathers followed by back and breast feathers. Hardly has this set of feathers grown out when another molt takes place, the pointed wing feathers drop out and the rounded wing feathers of the adult bird take their place.

Take for instance, the breed which I have had for the past twelve years—the Golden Wyandotte. When the chick is first hatched it is very dark brown, almost black, with a lighter spot here and there on its body. Normal growth shows chick feathers in wings an inch long when it is ten days old. These feathers (Continued on page 766)

A Historical Account of the Black Giants

VARIOUS poultry authorities have described from time to time the superb dressing qualities of certain French poultry breeds. In England, Germany and Belgium there are professional poultry fatteners. The "Patte De Fois Grass" of the Berlin delicatessen stores is paralleled by the splendidly fattened hens in Paris markets.

There are altogether more than a hundred distinct breeds and varieties of domestic poultry. Frequently these different kinds are divided into groups according to their geographic origin. The Leghorns and Minorcas are thus classed as Mediateranean breeds, the Dorkings as English and the Plymouth Rocks as American. Sometimes they are classified according to their utility qualifications. In this classification Leghorns are called an egg breed, Brahmas a meat breed and Wyandottes a dual purpose breed. Neither of these classifications is entirely correct and they should be superseded by a truly scientific grouping.

The Single Comb White Leghorn is an American product, the Light and Dark Brahmas were developed by American breeders and hardly any of their modern characteristics would be recognized in the old original importations of Brahma Pootras from China just prior to the Civil War. Our poultry breeds are all rather new and respond rapidly to systematic selective matting. Expert feeders find that all breeds respond in some manner to special feeding methods, and feed plays a part in their progress.

A Distinctive Meat Type.

Since the advent of the Egg Laying Contests in America actual progress has been made in breeding for egg production. Particular strains of many varieties have apparently inherited through successive matings the ability to produce more eggs. Almost nothing has been done in a public way to emphasize the needs or possibilities in special breeding efforts for a distinctive meat breed. Some fifteen years ago Prof. W. R. Graham of the Ontario Agricultural College established a meat strain of Barred Plymouth Rocks. He reported at that time that they were rather poor layers, took on fat easily and made a very fine dressed carcass. Some fifteen years ago Franklane Sewell, the American poultry artist, described in word and picture the dressed poultry trade of Europe. The farm poultrymen of northeastern Rhode Island created a mixed strain of fowls particularly for the Boston dressed poultry trade, but later selected them more and more for winter egg production, and the result is a splendid layer and an ordinary meat fowl today in the Rhode Island Red. While our various breed enthusiasts will doubtless contradict the statement, those who have had an opportunity to see for themselves fancy European dressed fowls, Boston South Shore roasters, Philadelphia capons and Swedesboro broilers, will acknowledge that America has no Standard breed which is a distinctly meat type. The European markets are supplied with pure breeds; the best American markets are supplied

By **ALEXIS L. CLARK**

**Origin, History and Development
—A strictly meat type—Should
be recognized as a Standard breed
—Modern breeders are interested.**

with cross breeds. Those who have watched the development of the Jersey Black Giants see in this breed the real meat breed of America.

It has originated because of market demand, type of farming, and persistent selection. The section of New Jersey where these fowls have been raised for fifty years is south of Trenton and is roughly bounded by Trenton, Princeton, Jamesburg, Freehold, New Egypt, Mount Holly and Burlington.

Origin of the Black Giant.

The New York and Philadelphia fancy markets demanded a large, soft-meated, roasting chicken with yellow skin and clean legs and as full meat as possible. The farmers in this section of New Jersey are general farmers dividing their attention between dairying, grain and potatoes. The

farms average 100 to 175 acres each and the soil is mostly a heavy, fertile loam. Near Jobstown, which is four miles from the United States Army Camp Dix, lived for many years two bachelor brothers, John and Thomas Black. These men kept a strain of especially large fowls. Dressed poultry buyers paid them a premium and competed hotly for their stock. As these men bred them, little attention was paid to color. They were a mixture of Asiatics and Cornish Game. Later Barred Plymouth Rocks were added to the cross. It is likely that these birds would never have been distributed

Old homestead of John and Thomas Black, originators of Black's Giants, Burlington County, New Jersey.

about if it had not been for Mr. William Ellis of Crosswicks. Mr. Ellis has been the professional caponer for that country district for many years.

Some thirty years ago Mr. Ellis realized the value of the Black Brothers' large strain of fowls. He advised his farmer friends to buy their roosters there and gradually Black's Giants, as he called them, were disseminated around that section. Sometime prior to 1910 the Rhode Island Experiment Station became interested in the breed of fowls that produced the best Philadelphia capons and asked Mr. Ellis to purchase a trio. The birds were shipped to Mr. Samuel Cushman of the Station, but were wrecked by the railroad and the claim was paid to Mr. Ellis. So the breed lost that opportunity to expand. The fowls naturally were partly black and here and there farmers built up by selection all black flocks. Mr. Charles M. Bunting was one of the farmers who kept his flock clear black and his son's wife has recently supplied foundation stock to new breeders. The Black Brothers died some twenty-five years ago, but the strain of large poultry they established continued in other people's hands. In 1911, Frank L. Platt, a noted poultry writer, and Prof. Alfred Lunn of the Oregon State College visited New Jersey to study this strain of fowls which had made a great reputation for producing what the trade knew as Philadelphia capons. Mr. Platt through his Trenton friend, Frank J. Eppele, was introduced to Mr. Ellis and Mr. Bunting.

The Reliable Poultry Journal of June, 1911, contains an account of the trip this party made through Burlington County, New Jersey, visiting flocks of Black Giants. It

Breeders Are Interested In Their Standard

THE Campine seems to have been marked for misunderstanding from the beginning. First it was said to be wild. Rev. E. Lewis Jones of Wales dispelled this idea only after years of combatting it through the English poultry journals. He always insisted that the Campine was active and tame, not flighty and wild. When the breed was imported to America, it was said to be delicate. One judge remarked: "Every time the moon goes under a cloud, a Campine drops out of a tree with the rump."

The English and Belgians fed no maize and birds suffered when imported to the United States and fed on a ration heavy with corn and shy of green stuff. American bred stock is today well acclimated, but birds so quick to grow, so sure to respond to good care, suffer from lack of care. For the poultryman who knows how to handle chickens, or for the beginner who is interested enough not to neglect his chickens, the Campine is one of the very best breeds.

Campines are a strictly single mated variety. The males are hen feathered, similar to a Sebright bantam. They are ideal pullet breeders. The aim of the breeder is to retain this hen feathering, and breed it as long as possible. The Standard calls for "back feathers, abundant, long, wide, ending with rounded tips." A typically cock feathered male has long, narrow, pointed saddle feathers. A typical Campine male's saddle feather is shown in Fig. 1. Some males have too short and too round, too typically hen shaped feathers in their back. Judges who assume that such feathers are good simply because they are nicely marked, overlook a fundamental character in the breed, and that is plumage development.

Another thing that is misunderstood. The Standard calls for lustrous green sheen in the black bar, and allows in the back section a black bar four times the width of the white bar. This has given rise to the erroneous impression that a narrow, spider-like white bar is not only allowable but desirable. The fact is that the white bar in the backs and saddles of the best birds, is open, not contracted as narrow as possible. Any one can breed little, narrow white bars, but you do not find them on the best birds at the New York or Chicago Coliseum shows.

To emphasize the importance of the right kind of white barring in this variety, the Standard Committee recommends that the Standard be changed to call for a black bar three times the width of the white bar, instead of four times the width.

Feathers, Nos. 1 and 3 are from a Silver Campine male saddle and wing bow, respectively, and show the 3 to 1 ideal. Feather No. 2 is from the male's breast. The present Standard calls for a black bar in the breast that is three times the width of the white bar. The Standard Committee recommends that this be changed to a black

By FRANK L. PLATT

The Progressive Campine—Cochin breeders satisfied—Leghorns of sufficient size—Barred Rock agitators like scandal—What to do with R. I. Whites and Giants—The Orpington Standard.

bar twice the width of the white bar. It will be seen that in actuality the barring on the breast is of equal width, but it cannot be questioned that the ideal male would be a consistently barred bird, one that carried practically the same kind of markings in back, wing bows and breast. Such a bird has not been produced, but it is well to have a rather high ideal at which to aim.

Feathers Nos. 5 and 4 are from the back and breast, respectively, of a female. It will be noticed in all these feathers that the barring is much straighter across the feather than it used to be. While the Standard still allows a slightly V-shaped white bar, the best specimens are showing more and more straightness. It will also be noticed that the feather from the female's back has four white bars. Three used to be common.

The variety is in good hands. Frank E. Hering gave up his Leghorns several years ago for his Campines, and is always enthusiastic when relating how fast the Campines grow, and what good layers and light feeders they are. C. A. Phipps of the Homestead Campine Farm, to whom we acknowledge the courtesy of the feathers here illustrated, writes:

"We have had out our first lot of chicks now almost three months. I should say a pair of them was worth about \$1,000.00. They look wonderful to me, beautifully developed in every way; wonderful type and color and white hackle with splendid breast color or marking. Not a droopy bird on the farm, young or old. The chicks grow like weeds, eat like the devil and fly all over you, active but not wild. We had a chicken today for dinner that was more like a spring chicken than one over a year old—the only breed I know that is never too old to eat and never too old to lay. We have them 8 years old, Standardbred, prize winners, legs as clean as a pullet's, wonderful color and still laying 3 and 4 eggs a week, and did it all winter, and each winter and spring and summer. Talk about Campines, there is no other breed."

Barred Rocks.

Mr. Robinson, secretary of the Barred Rock Club, expresses his attitude on the Barred Rock situation as follows:

"It would appear that there was an understanding in A. P. A. circles that regardless of the official request of our club (to divide the variety) the said official request would never be granted. . . . It is not for us to yet say bluntly that the A. P. A. is playing crooked with us, by basing our statements on the report from the Revision Committee. The A. P. A. has time to show itself an honest organization. . . . To date, individual connections have evidently swayed the Revision Committee and prevented them from giving us an unbiased consideration."

The fact of the matter is, the Standard Committee was not prejudiced against Mr. Robinson, Mr. Cowan and Mr. Johnston, the three gentlemen who represented the Barred Rock Club. Mr. Robinson should concede that there are two sides to the question of dividing into two sub-varieties, one of the oldest and most firmly established breeds in the Standard. Moreover, he should recognize the fact that the constitution of A. P. A. has set up certain limitations on the recognition of new varieties. He should remember that the Committee of Forty recommended and the Seattle convention passed a resolution against dividing varieties on the basis of different shades

Clean, open, straightly barred feathers from modern Silver Campines.

of color. Mr. Robinson is publisher of the International Plymouth Rock Journal, and the language used in discussing the subject in that publication is intolerant. We quote the following from the May issue of that publication:

"We all know that the one variety trust, that criminal combination in restraint of trade, will keep up the fight to restrict the showing of Barreds. Working in the dark, like any common assassin, they are trying to get a hold upon show managements which will result in shutting out the breeding specimens We are morally right and numerically outclass the enemy, and what is of special import, they know they are wrong, they are shame-faced, ignoble in their intents and purposes and despicable in all their methods."

Again we quote from the May issue of the same publication:

"It is said to be a forgone conclusion that the A. P. A. will turn us down. If such proves to be correct, Hearty knows of a big crowd who will down present A. P. A. officials. Aye, will knife them to the heart."

We have been reading poultry papers for more than twenty years, but such language strikes us as a new departure. Can it be that words do not mean as much as they used to? Criminals, working like common assassins, to be knifed in the heart! Those who thought they held an honorable objection to splitting up the Barred Plymouth Rock are "ignoble in their intents and despicable in all their methods."

That is a pretty strong indictment.

Here's another one, from an editorial appearing in the March issue of the International Plymouth Rock Journal. We quote:

"When judges of national reputation become so steeped in crime that they can no longer be trusted to render an unbiased decision, the exhibitors should have some sort of redress."

In commenting on this outburst, Editor Donovan of the Canadian Poultry Review, asks if any of the Canadian poultry judges are "steeped in crime," and then adds:

"Isn't this pretty hot stuff? Have the 'reds' entered the poultry business in the United States? If they have we trust they will leave us alone in Canada. We don't want it nor do we believe for an instant that there is any truth in the statement that 'judges of national reputation have become so steeped in crime that they can no longer be trusted to render an unbiased decision.' Surely the great multitude of American Barred Rock breeders, or breeders of any other variety for that matter, do not accept a statement of this lurid nature. An honest difference of opinion or the different interpretation of a written Standard must always be accepted. We don't all look alike, we don't all think alike and it's a mighty good job that we don't else we would be like so many peas in a pod with the little one at the ends. It is up to our editorial conferee to withdraw this extremely broad statement, to put it mildly, and surely he is for furthering the interests of the Plymouth Rocks of any color by sending forth broad-cast such a statement. The A. P. A. would be justified in asking for proof of such statements and then follow with its judiciary powers."

Editor Donovan rightly calls for the judiciary power of the A. P. A. That refers to a court of justice and the rendering of judgment. It is high time that some high power in the fraternity should render a verdict on loose talk; it is high time that the A. P. A. should meet these acrimonious attacks on its judges, its committeemen, itself. It is time to ask for proof and if the charges are found to be groundless, and only to incite distrust and dissension, then said publisher should retract them and publicly apologize.

All of this ill humor in the Barred fraternity has been stirred up by those who maintain that two varieties should be recognized as Standard, Light Barred Rocks and Dark Barred Rocks, when the fact is that in well bred birds the pullet-bred female and the cockerel-bred male are the same shade of color.

They maintain that the big breeders don't want to help the little breeders, whereas the very men who would most benefit by a two variety program are the big breeders who have the equipment, resources and know-how to breed exhibition pullet-bred males and exhibition cockerel-bred females in case the public wants to humbug itself into buying exhibition instead of breeding birds in these breeding classes.

They say that certain judges, editors and breeders are co-operating in aiding and assisting the one-variety program, and that the Standard Committee has been influenced by them, whereas in point of fact, the Standard Committee has gone out of its way to try to compromise the situation. The Committee went to considerable effort to properly describe a pullet-bred male and a cockerel-bred female in the preamble to the breed, and explain how these two birds are related to the Standard male and female

In no other variety in the Standard is the breeding problem discussed, yet to help the advocates of single mating in Barred Rocks, considerable discussion on mating has been included in the text.

It should not be overlooked in the heat of the controversy that the Barred Rock Club has filed a petition for the recognition of Light and Dark Barred Rocks. That petition, in the ordinary course of events, will be ripe for action by the A. P. A. at the annual meeting one year hence, August, 1923. If the new Standard is delayed, this issue will be a very live one up to that time.

Those New Varieties.

An English poultry paper tells of a new Dutch breed, the Barnevelder, "handsome, well set up bird, with grand carriage. In the males, the breast is a dark beetle green, very lustrous, with bluish shoulders, and dark lustrous green-black hackle." That sounds like something new, something distinctive, qualities that should be encouraged.

On the other hand, information reaches us that E. C. Branch has a petition for the recognition of single comb Golden and Silver Sebright bantams. The petition for the recognition of these single comb sports is to be pressed, we understand, in case Rose Comb Barred Rocks, Black Giants and Rhode Island Whites are admitted as Standard varieties.

We favor the encouragement of distinctly new varieties, and we dislike to see the multiplication of nearly similar varieties, but what is one going to do? While some beautiful and wonderful breeds lie dormant, new claimants push forward. The Rhode Island Whites are an established fact. There are a thousand breeders of them. It is an actual condition, not a theory, that confronts us.

The Standard Committee in making its recommendations on the admission of Giants, R. I. Whites and Rose Comb Rocks, was guided by these principles that it believed should underlie the Standard. The Committee labored under the constitutional injunction, "safe guard breed type." The Committee rendered a logical objection to recognition. But practice and logic are different things. Cold logic knows no compromise. It is the perfectly logical De Valera who has driven Ireland to the verge of civil war. All great statesmen meet up with times when they must compromise, perhaps with their wife, perhaps with their friends, perhaps with the public. Life is a compromise.

We hold that such compromise as is necessary on the recognition of the new varieties in question, should be made by the Knoxville Convention. The Standard Committee would be a bunch of chumps to render a report to the interested public, then at the last minute change their recommendations and bring in an entirely different report to the Knoxville Convention.

Fortunately the Standard Committee has a chairman that is steadfast, a man who stands four square to the wind. Chairman Branch has ruled that inasmuch as the Black Giant matter was reconsidered at Chicago, and has been reported out by the Committee, he will not entertain a motion to again reconsider the matter. We heartily support that ruling.

But, when the matter comes to a vote in the convention, you will find this writer ready to compromise. He will probably vote for Rose Comb Rhode Island Whites, just as he did in the Committee, and for Black Giants. But he is opposed to the Standard Committee changing its report on the admission of these varieties. The constitution charges the Standard Committee with the responsibility of safe guarding breed type, and the Committee would be derelict in its duty if it should fail to point out the similarity in breed characteristics between Black Giants and Black Javas, Single Comb Rhode Island Whites, and White Plymouth Rocks. That report should go to the convention. The A. P. A. is entitled to it.

It is then time for the Black Giant men to say to the members assembled in convention at Knoxville: Yes, gentlemen, the Black Giant has the same single comb, red lobe, black plumage, black shanks and yellow bottoms of feet carried by the Black Java, but the Giant is bigger than the Java, heavier bodied, and no competent judge would error in selecting a typical Giant from a typical Java. You now have in your Standard a similar set of breeds. The case is parallel between the Rose Comb Black Min- (Continued on page 754)

The Leghorn Condemned As a Farmer's Fowl

THE EGG AND POULTRY WORLD," a paper published by the "Associated Egg and Poultry Experts," in the interests of "the so-called middleman, the cold storage warehouseman and the transportation agencies," has taken up the fight of the poultry buyers against the Leghorn breed of fowls.

The Leghorn is a highly specialized breed whose strong forte is the production of eggs. Just what is the matter with the Leghorn as a table fowl does not seem to be well established. In Indiana, for instance, poultry buyers pay about 4c a lb. less for Leghorn hens than for hens of the dual-purpose breeds that weigh 4 lbs. or over. That seemed to be logical for it is pretty generally understood that 100 lbs. of small hens will produce less meat and more bone and offal than 100 lbs. of big hens. In Missouri, on the other hand, we found that St. Louis commission houses paid as much for Leghorn cocks and hens as for other old fowl, but paid 12c a lb. less for Leghorn springs than for 2 lb. broilers of the dual-purpose breeds. In the big Union retail market, St. Louis, dressed Leghorn broilers sold at 50 to 55 cents a pound, the same as broilers of other breeds.

Dr. Mary E. Pennington, formerly head of the Food Research Laboratory of the U. S. Bureau of Markets, was the first prominent critic of the Leghorn.

Poultrymen realize that the Leghorn cocks and hens are deficient in size and fleshing qualities. It is largely for this reason that dual-purpose animals are most popular on mid-western farms, whereas highly specialized milk and egg types in animals are most popular on the eastern and western coasts which are removed from where the feed is grown, or on highly specialized dairy or egg farms wherever located.

This war-fare of the breeds will go on indefinitely. The breeds are all in competition with one another. The "best breed" for each condition will not be determined by propaganda but by the fitness of that breed to meet the particular economic condition under which it is handled. What is the best breed under one condition may not be the best breed under another condition.

The attack on the Leghorn, from "The Egg and Poultry World," is reprinted in the center of this page, and a letter addressed to the editor of that publication, written by A. F. Rolf, Secretary of the National White Leghorn Club, follows:

Mr. I. Unkenholz, Editor,
The Egg and Poultry World,
Chicago, Ill.

Dear Sir: Since writing you yesterday, a friend has sent me a copy of the March issue of your publication. My friend, Hon. Harry D. Wilson, Commissioner of Agriculture for Louisiana, has also sent me copy of his letter to you relative to your statements regarding the Leghorn.

I regret to see the attitude your publication is taking against our variety—the Leghorn—and believe that there are aspects of the situation which you do not wholly understand.

Please understand me, right from the beginning—I do not doubt your sincerity, or your desire to effect an improvement in the market poultry and egg business.

Right off the bat, I want to admit that the Leghorn is not a market table poultry fowl. We readily concede that. However, I want to

state, also, that I know that the quality of the average Leghorn, as it reaches the market, is not a proper basis on which to criticize the possibilities of the Leghorn, even as a market fowl.

I have been, in the comparatively recent past, engaged in the production of broilers for one of the most critical restaurant trades in the country. Our production experiments included White Leghorns, Rhode Island Reds, Barred Rocks, and Orpingtons. We found that, by proper methods of handling, the Leghorns gave us the best results and that farm is now producing nothing but Leghorns and is satisfying their exceeding critical trade.

Leghorn broilers, when properly produced, are not "tasteless, stringy and of a hard fibre" as you stated in your criticism. I freely admit that the mass of broilers marketed are not properly produced, but do claim, and know, that they can be properly, and profitably produced so as to meet the demands of the most exacting. This requires intelligent feeding, the attainment of desired size as rapidly as possible, and a finishing (sometimes called fattening, or more properly, fleshing) period. By crate feeding for the last 10 to 14 days, using one of the condensed buttermilk preparations (perhaps fresh skim or buttermilk would be better) one can produce a Leghorn broiler which will equal anything you ever saw, and do it more quickly and easily than with any of the larger, slower maturing varieties.

I hold no brief for the market qualities of old Leghorn hens or cocks, although even these can be improved greatly and, except for size, most of the present objections may be profitably removed.

We need education.

I, personally, would not object to any just discrimination in price against improperly marketed Leghorns, but I do not think it quite fair, or just, to condemn the breed as a whole, simply because ignorance, or prior lack of necessary incentive, has caused producers to neglect this point.

Now in regard to size of eggs. We all know that the early pullet eggs of any breed of poultry are smaller than those produced after fowls reach maturity and that this difference in size is more marked with the Leghorn than with the heavier breeds. This is, I believe, because the Leghorn starts laying so much earlier than the heavier varieties and, in fact, so much before it reaches its ultimate mature development.

But, while there doubtless are some flocks, perhaps some strains of Leghorns, which do not produce as large an egg as might be desired, this is a matter which can easily be overcome by proper selection. The size of egg is an inherited character, and can be fixed in a strain by proper selection of breeding stock and hatching eggs.

I have a flock of "White Leghorns" which will average, in size, around 3½ pounds for pullets and 4 pounds for hens, and about a pound heavier for the males of corresponding ages, and except for the first pullet eggs, this flock produces an egg which will average slightly better than 28 ounces to the dozen. With the exception of occasional and exceptional flocks of the heavier breeds, this is about as heavy an egg as you will find. I can cite you to any number of flocks which will produce eggs of similar weight.

I am satisfied with a 28-ounce egg, and I believe you would be.

Again, we need education.

A just discrimination in price, based upon an equitable system whereby the producer would be the one affected, would enable us to attain this result more quickly than by any other. But, again, I do not think that shortcomings which are directly the result of an old-fashioned, and improper, marketing system should be used as the basis of a "Swat the Leghorn" propaganda.

Experiments conducted on an unbiased basis, by the United States Department of Agriculture, show that it requires 4.8 pounds of feed to produce a dozen eggs from Leghorn pullets as against 6.7 pounds from the heavier variety pullets (such as Rocks, Reds, etc.,) Likewise Leghorn yearling hens produce a dozen eggs on a food consumption of 5.5 pounds of feed as against 9.6 pounds for the yearling hens of the heavier varieties.

The average production, for two years, from each Leghorn hen in

(Continued on page 763)

(The following article is reprinted from "The Egg and Poultry World.")

"DISCRIMINATION AGAINST LEGHORNS EVEN FROM SAN FRANCISCO."

"The Chicago Poultry Board has passed a rule that Leghorns cannot be sold as springs, but must be sold as Leghorns. In other words, springs sold on the call shall not contain any Leghorns.

"Even in the glorious climate of California it seems, they do not think anything at all of Leghorns of the broiler or fryer sizes and the Leghorn hen they quote four cents below the 'colored' hen, while even the old roosters of the much despised Leghorn breed sell for two cents a pound less than their big brother.

"We wonder how long it is going to require to convince the farmers and poultry raisers that it don't pay to raise Leghorns? Nobody wants them for the table, and as for the eggs they lay, even admitting that they lay a considerable number more than the larger fowls—the total weight of their lay, will fall far short of the large fowl on account of the small size of the Leghorn egg.

"It is to be regretted that the Government bulletins advise the farmer to raise Leghorns, and we hope the State Bureaus of Markets will see the folly of it and discourage the practice.

"If the country shipper will impress the importance of swatting the Leghorn, onto the Bureau of Markets in his state they will be found to be the most effective agency to enlist in this work.

"In states where there is no Bureau of Markets the county agent should be posted on the facts concerning the Leghorn as a market fowl and urge him to discourage the raising of these chickens that are a detriment to the state. They are the 'Ben Davis' of the poultry yard, contain scarcely any flavor at all at any age and as broilers or frying chickens their meat is tasteless, stringy and of a hard fibre. One Leghorn in a box of broilers or springs will cause a loss of a dollar on that box to someone along the line of marketing and when the consumer won't pay the price the producer will have to lose it in the end."

St. Louis Poultry Market

POULTRY, as a matter of course, ultimately reaches the butcher stalls, and poultrymen are naturally interested in the commercial poultry market. Ten years ago we started out to find what was what in the leading poultry markets of the country. That trip of 1912 included a survey of the New York, Boston, Philadelphia, Chicago, Kansas City and St. Louis markets. We started in at St. Louis, and ten years later, May 31, 1922, we retraced some of the old foot steps along commission row in St. Louis.

A difference of ten years in time, but not so much difference in price. On April 24, 1912, one and a half pound broilers were worth \$8 a dozen or 45 cents a pound. On May 31, 1922, large broilers of 2 lbs. or a little better, were worth 47 cents a pound. These are the prices that commission houses were paying shippers. Eggs in 1912 were 19 cents and in 1922, 21½ cents, with Arkansas and Southern about 2 cents less per dozen. Occasionally one hears about poultry and eggs bringing "war prices," and a dire prediction is made of what will happen to the poultry industry when market prices are liquidated. The fact of the matter is that springs and eggs are not much above 1912 prices, and there is no inflated war-price bottom to drop out. The poultry business is prosperous because it is prosperous, and there is no particular reason for any Calamity Jane attitude.

We found in 1922 that a strong prejudice had developed against Leghorns. While heavy springs were 47c, the same buyers were quoting 35 cents a pound for Leghorn broilers. This is a differential of 12 cents. Nice big, black plumaged broilers, well fleshed and of good size, were being quoted the same as Leghorns, 35 cents. There is discrimination by these buyers against both black plumage and Leghorns.

As we walked along the street with Professor W. H. Smith of the Animal Husbandry Department of the Illinois College of Agriculture, he commented on the good appearance of the Plymouth Rock "springs" that were crated. Such good breeding was not seen in the St. Louis market of ten years ago. Again, the Rhode Island Reds showed the ear-marks of pure-breeding. Such color was not available as market poultry in Missouri a decade earlier. The fancier is getting in his work, elevating the quality of the flocks of the country. No doubt about it.

The paying prices for cocks was 12 cents and for hens was 23 cents. There is no discrimination against Leghorn cocks and hens, although one commission dealer who was weighing in a crate of fine, big, Buff Orpington hens, seemed to take particular satisfaction in them.

There were numbers of Rhode Island Reds on the market, both single and rose comb, and cocks of this breed, through with the breeding season, showed good quality for farm chickens. One crate of Barred Rock springs would have been grown out for prize winners ten years ago. They were clean, straight barred chicks. Standard poultry is increasing—plainly increasing on the farms. The market shows it.

One buyer remarked that more chickens go to eastern markets than went ten years ago. A great deal of the stuff never stops in St. Louis. Refrigerator cars carry it to the great consuming centers of the east. One country buyer at Troy, Mo., ships a million dollars worth of poultry and eggs a year. The stuff goes to eastern markets. There are other big receivers and shippers in nearly every county in the state.

Eastern men are taking notice of poultry developments in the central west. Eastern poultrymen have been secure in their business of buying western feed and converting it into eggs, as long as they could produce superior quality and sell it at a remunerative price. Now the western agricultural colleges are talking quality, preaching the grading of eggs, and

western producers are putting a better and better product on eastern markets. In Minnesota, ten new egg producing districts, patterned after the Barnum, Minn., district, have been started the past year. The hens are in the west, from Minnesota on the north to Texas in the south; the hens are close to where the grain is grown; and eastern poultrymen are beginning to give some little thought to their quality egg market and the possibility of the west capturing that market with a quality product.

The poultry business in the west is immense. One buyer in St. Louis said:

"The stuff flows in here every work day of the year. People have incubators now-a-days. They hatch early. Between incubators on the one hand and refrigeration on the other, time and season are annihilated."

A great deal is said about the poultry business being "a billion dollar industry." Now and then one bumps into a phase of the operations that impress him with the hugeness of the thing. Such an instance occurred up at Columbia, Mo., the seat of the State College of Agriculture, when Professor T. S. Townsley drove us over to the Missouri Poultry Farm. There we walked into one hen house, 48x60 feet. A great hopper is built in the center of the house. The feed is mixed in the loft and shoveled down into the hopper like grain pouring into a feed elevator.

In the incubator cellar there are five machines. Each one is 120 feet long, double decked, and holds 40,000 eggs. The capacity of the cellar is 200,000 eggs at one sitting. The machines still appeared to be full of eggs at the time of our visit, June 3rd. We asked the proprietor of the hatchery, Manuel Drumm, how many hens it took to feed the hatchery with eggs. He replied:

"Twenty-two thousand hens on 140 different farms. We set 10,000 eggs a day. These cost us \$10.50 a case, and I am now paying my producers \$1500 a week above market prices for their eggs. Another year I am going to start a breeding farm, to furnish the males for my co-operators. I will breed and grow the cockerels for them. It doesn't cost any more to grow a \$25 cockerel than a \$3 one. Good purebred cockerels of any breeding will help me to give better quality chicks to my customers. I have already bought a farm for this breeding work."

"In regard to the varieties of chicks I handle,—I thought I had 12, but my Buff Rock flock fell down, and so I really have 11 varieties. I would say off hand that two-fifths of the chicks I sell are White Leghorns, and one-fifth are Barred Rocks. I should say that these two varieties make up from a half to three-fifths of my total business."

Mr. Drumm is now figuring on adding another 40,000 egg incubator this fall, to be ready for next season. He says that a man should have something to sell in the poultry business the year round, and he regrets that he hasn't at least 15,000 young pullets ready for disposal, for he is getting inquiries for partly grown pullets right along.

Yes, the poultry business is big. It is growing bigger. But, that is looking through a telescope. The microscope reveals things no less wonderful. Let us see. There are feathers. They are light, little, insignificant things. Nobody eats them and years ago there was only a supposed-to-be-market. Now the St. Louis papers quote the market on feathers the same as they do on clover seed, wheat and U. S. Steel, as the subjoined clipping from a St. Louis daily paper for May 31, 1922, indicates:

Feathers—Per pound: Prime white live geese, 78c; prime gray, 53c. Duck—White, 53½c colored, 33c. Chicken—Prime dry-picked body, 12½, green, 2c; musty not wanted. Chicken and Turkey—Body, mixed, 3c. Turkey—White body, 35c; green, 25c; colored, 5c; green, 3c.

There may be danger of over-production in poultry and eggs just as in corn, apples, hogs, automobiles or sewing machines, but as long as wages and employment are such that living conditions permit wholesome consumption, there is not danger of under consumption, which also goes by the name of "over-production."

The Distinction Between An Egg Farm and a Breeding Establishment.

One is a White Leghorn egg farm for the production of commercial eggs for market. The other is a White Leghorn breeding establishment that supplies eggs for hatching, baby chicks and stock birds.

What is the difference?

The time was when people would say that one was "utility" and the other "fancy." It is still true that the egg farm reproduces its stock purely for utility purposes without highly critical selection for Standard qualifications. But, it is not true that the modern breeding establishment selects purely for exhibition purposes without regard to egg production, constitutional vigor and practical qualities.

The big, successful, forward looking White Leghorn breeding establishments today are breeding flocks that possess all that utility requires in combination with Standard quality.

Times change. The attitude, and outlook, and business of breeders change. Nothing in this world is settled in the sense that the word "settled" is often used, for as long as there is advancement of knowledge, there must be development and progress in our methods. This getting out of the old rut is illustrated by the change that has come over the National S. C. White Leghorn Club, an association of purebred breeders. The Secretary of that Club, Arthur F. Rolf, has written:

"This Club, but recently organized, was originally organized in 1903 as a fanciers' body, but gradually declined and became inactive about 1913; reorganization started in 1920 and the Club is now functioning for the advancement of the Leghorn from an economically sound basis."

In other words, the White Leghorn Club is interested in the useful application of the breed, and is fostering that type which is especially adapted for useful application. This does not mean throwing away all regard for whiteness of plumage, nor does it mean disregarding symmetry of form. But it does mean that the pure colored, symmetrical, Standardbred bird must stand on a foundation of usefulness.

That is the fundamental attitude of the modern breeding establishment. It isn't merely a place where "fancy chickens" are turned out. It is a place where utility is combined with pure breeding—a place that fits into the great scheme of agriculture, just as the nurseryman who supplies seed stock of superior value, fits into the wide system of agriculture.

Stock from these modern breeding establishments is not pampered. It is not soft. Stock to go from the breeding nursery, out into the world, must be fit, and breeders have learned the need of ruggedness so that their eggs and stock and chicks will "stand up" in the hands of Mr. Average Poultryman.

Time was, twenty years ago, when fancier-breeders expressed contempt for utility, and asserted their "superiority" by saying: "Just so my hens will lay enough to reproduce themselves." And then, after the chicks were hatched, they were pampered into full development.

Today one gets an entirely different view of the purebred poultry business when he visits a fancier-breeder such as Frank Gloeckl at Hillview Farm. He is a breeder of winners in the show room. No doubt about that. Let us look at the practical end of his work.

We sit down in the incubator cellar with P. Sciarra, proprietor of the farm, while Gloeckl toe marks chicks. There is in this cellar, 22,000 eggs capacity at one sitting, and it has proved inadequate to the demand for chicks. The egg trays that are coming out show several 100 per cent hatches—not a whole egg left in these several trays. Some experienced incubator men will not believe it. We saw it. And as a suggestion, let us add for the benefit of those who judge every outside report according to their own fireside experiences: It is a good tonic to make a trip once in a while, to get a change of scenery, a change of air, a few new ideas. We believe in this medicine and take it.

As Superintendent Gloeckl toe-marked the chicks, he was especially quick on the trigger. We have seen a good deal of commercial egg farms and hatching cellars, but we never saw a hatcher snuff out the life of so many chicks. Aside from any esthetic notions about the thing, he is a hard culler all along the line. Partly hatched chicks that are sure to come, al-

though a little late, and chicks that haven't a smooth head and fluffy neck with the ability to stand strong, go into the dump. They are not from 28 cents per dozen eggs, a price that some of the hatcheries pay; they are from \$20 per 15 eggs, but there is no coaxing of a possibly weak chick, no pampering, no deluded notion about vitality being acquired as the chickens grow, rather than being inborn at the start. We do not mean to intimate these hatches of chicks were weak; no utility flock produces chicks with fluffier down, bigger eyes, heavier skulls, larger legs and feet. It is a case of rigid selection that starts with the eggs and chicks and is then carried right through the flocks. Said Mr. Gloeckl:

"I dare say you never saw better chicks or better hatches. Tony, our incubator man, is a wonder at operating these machines. But, I go at this selecting business hard and in dead earnest. Am rigid in my selections all along the line, and have been for years. Vitality is a mighty important thing. No one can get size, feather, eggs, growth, or satisfaction, without it. And a man humbugs himself when he thinks that vitality can be acquired and need not be inherited. If I held such a delusion, and let a half-way good looking chick pass out of the incubator cellar or get through the brooder house, I might lose track of the fact that it was weak at some period in its life, and breed it.

"The result would be a taint of weakness running through our stock. I would then have to cull a hundred birds instead of one.

"If a man is going to win a foot race or a boat race, he wants to get off at a flying start, and then keep going. I want only chicks that have a good start and then keep going. Have simply got to have that kind. I inbreed them pretty close. I make no bones about saying so. It would be foolish to do so. I keep the vitality—you saw the hatches. Before you in the brooder house, and up and down the valley, are the chicks. I am proud of their breeding. Here is a grandmother, a daughter and a grandson, mated together. What do you say, isn't that a better cockerel than I showed at the last Coliseum Show? He is mated close enough as far as blood relationship goes, yet one of those perfect hatches of big chicks that I took off down in the cellar is from this mating. Here are the eggs they are laying. I haven't gathered them out of the nest this week. How are they for size, and shells and quality? Let us put some of them on the scales. There you are—that is equivalent to 30 ounces to the dozen.

"It is easy enough to get a bunch of 200 egg hens if record is all anyone wants. But, some people are complaining about small size of eggs, tinted shells, texture and shape of shells in those cases where every other consideration has been sacrificed for mere numbers of eggs.

"There is a little secret about this pullet. We don't tell anyone for it would do us more harm than good; but Pete Sciarri is here now, and he was a witness to the final feat. That pullet laid 29 eggs in the first 29 days of April. On the 30th of April I went to see if she had finished the month with a perfect score. I found she had. Pete, here, did the same and he found the second egg. They weren't laid as far apart in the day as some people would imagine. Better not print this 31 eggs in 30 days. If a man wants hot air, he can find it on every street corner of the poultry business. But, you and I have known each other for fifteen years, and I thought you would be interested. It will probably never happen again in our experience. One thing sure, we are not going to capitalize on a freak record of this kind in our advertising."

There is one thing in which a breeding farm should not be confused with an egg farm. The breeding farm is interested in producing ten dollar a sitting eggs in March, April and May. The egg farm is interested in producing one dollar a dozen eggs in November and December. Now, egg production is nothing more or less than reproduction. The natural season of reproduction is March, April and May. To set that season ahead, longer day lengths are employed by means of artificial illumination. That gears up November and December production. But, the hens do not know that they are laying eggs for somebody's breakfast; they think they are reproducing their own kind. They lay some of the strength and substance out of their bodies in the winter with the result that the hatching eggs they yield in the spring are correspondingly weak. It follows, therefore, that a breeding establishment must conserve energy. Said Mr. Gloeckl:

"Positively no electric lights on my breeding hens in winter. I'll make this exception: on a very cold night, I will light the breeding pens early in the morning. If the males are going to freeze their combs or wattles, they will do it between 4:00 a. m. and day break. Their crops are empty then, and that's when the frost bite hits. In extremely cold weather I get them down from the roost to an early breakfast. But to turn my good breeding hens into slot machines, shelling out eggs in November and December, just because the egg market is up,—well, Pete Sciarri isn't that kind of a short sighted boss, and I haven't lost my understanding of the absolute importance of handling our stock so as to secure maximum fertility and vitality. This isn't a game of feathers on the one hand and eggs on the other. The mainspring of a breeding establishment is vigor. I keep that mainspring from getting run down.

"I like good plumage. Years ago, you and I talked about quality of feather, when some other fellows were too busy measuring tail carriage to think of anything else. It has been my ambition for years to breed a bird that wouldn't break over (Continued on page 741)

American Poultry Association Convention

The 1922 convention of the American Poultry Association will be held in Knoxville, Tennessee, August 8th to 12th, 1922.

Knoxville is a delightful city. It is situated high up in the mountains. The Knoxville people have arranged to make the week a very pleasant one for all who attend the convention.

Hotel Farragut will be official headquarters.

The railroad companies have granted a rate of one and one-half fare for round trip tickets, on the certificate plan. Every person deciding to attend the convention should write the undersigned for a copy of this certificate. This certificate must be presented to the local railroad agent of whom ticket is purchased. Tickets will be on sale August 4th to 8th, the final limit of ticket being August 19th. Stop-over privileges will be allowed on all tickets, both going to and returning from the convention. Write the undersigned, 655 W. Third Street, Ft. Wayne, Indiana, or Carlos C. Campbell, Manager Board of Commerce, Knoxville, Tennessee. We will be glad to supply any desired information.

The Standard Revision Committee will make its report to the convention, and here the text and illustrations of the 1923 Standard will be determined. Bring your Standard with you.

MEETING BOARD OF DIRECTORS AMERICAN POULTRY ASSOCIATION

Pursuant to the duty imposed upon, and the authority granted me, I hereby call a meeting of the Board of Directors of the American Poultry Association, such meeting to be held in the Hotel Farragut, Knoxville, Tennessee, August 4, 1922.

CALL FOR MEETING OF STANDARD REVISION COMMITTEE

The Standard Revision Committee, American Poultry Association, will meet at Hotel Farragut, Knoxville, Tennessee, Friday, August 4, 1922. Notice of this meeting is given thus early in order that the specialty clubs, fanciers, and breeders may fully prepare such matters as they intend to submit to the committee and make all arrangements in connection with the appointment of such persons whom they will designate as their representatives before the committee.

AMERICAN POULTRY ASSOCIATION,
THOS. F. RIGG, President.

Programme

MONDAY, AUGUST 7TH

Meeting of Board of Directors. at Hotel Farragut—Poultry Show Association—Poultry Judges' Association—Poultry Instructors' Association—Poultry Publishers Association.

Registration at Hotel Farragut.

TUESDAY, AUGUST 8TH MORNING, 9:00 O'CLOCK

Convention called to order by President, Thos. F. Rigg; Address of Welcome, Dr. H. A. Morgan, President of University of Tennessee; Response by President Thos. F. Rigg; Roll Call of Members; Report of Election Commissioner, O. L. McCord; Election of Board of Review; Appointment of Committee on Credentials.

Adjourn 12 Noon; Luncheon; Served by Security Mills & Feed Co., W. J. Savage and Co., and Other Manufacturers of Knoxville.

AFTERNOON, 1:30 TO 5 O'CLOCK

Report of Finance Committee; Report of Credentials Committee; Reading of Minutes of Previous Convention; Reception of Petitions and Memorials; Report of Board of Directors; Adjournment; Guests of Reception Committee; Seeing Knoxville.

WEDNESDAY, AUGUST 9TH MORNING, 9:00 O'CLOCK

Report of Standing Committees: Committee on Legislation; Committee on Education; Committee on Judiciary; Committee on Poultry Shows; Committee on Licensing Judges; Committee on Welfare, Grievance and Appeals.

Adjourn 12 Noon; Luncheon Served by Quaker Oats Co. and Full-O-Pep Dealers.

AFTERNOON, 1:30 TO 5 O'CLOCK

Report of Committee on Market and Transportation; Report of Committee on Medals and Diplomas; Report of Publicity Committee; Constitutional Amendments; Unfinished Business; Report of Board of Review; Inauguration of Officers; New Business; Election of Election Commissioner.

Adjournment to 7:00 P. M.; Banquet by Knoxville Board of Commerce.

THURSDAY, AUGUST 10TH

MORNING, 9:00 O'CLOCK
New Business (Continued).
Report of Standard Revision Committee.
Adjourn 12 Noon.
Luncheon served by East Tennessee Poultry Association.

AFTERNOON, 1:30 TO 4 O'CLOCK.

Convention Session.
Adjourn 4 O'clock.

EVENING, 5:00 TO 9:00 O'CLOCK

Boat Excursion to Riverside Poultry Farms.
Watermelon Party.

FRIDAY, AUGUST 11TH

MORNING, 9:00 A. M. TO 12 NOON
Convention Session.
Adjourn, Luncheon.

AFTERNOON, 1:30 TO 5 O'CLOCK

Convention Session.
Final Report of Board of Directors.
Adjournment.

EVENING, 7:30 O'CLOCK

Theater Party.
Programme subject to possible slight change.

Some of the sessions of the A. P. A. Convention at Knoxville, will be held at Chilhowee Park, the famous site of the Appalachian Exposition. A beautiful lake is situated in the center of the Park's sixty-nine acres of shaded slopes.

The Distinction Between An Egg Farm and a Breeding Establishment.

(Continued from page 739)

saddle and at juncture of I have breed for width of saddle feather by selecting females erts well up on tail. Here, take ahold of the first cock at the last Coliseum show. Let us measure one of his underlying feather. It measures 7¼ inches long and 1¼ inches wide. Cut a tail feather from thta female. Don't pull it, for I want to show her next winter, and want her to molt evenly. There you are, 1¼ inches wide.

"This hen has a nice shaped tail. I want the main tail feathers to be the right length. Some tails, especially in the males of some strains, are too long at the top; and if you pulled off the sickles and coverts and looked at the shape of the main tail feathers, the top feathers would be altogether too long. I want the tail to be proportioned more like the ribs in a fan. When the top feather in a female tail is 7½ inches long, and the bottom feather is 6¾ inches long, quill and all, you have about the right proportion.

"In getting those backs that are well filled in front of tail I do not depend altogether on feather. I want a bird that is wide across the hips, and then I want him to carry that width well back to stern. I put a lot of importance on straight sides—not merely when you look at the bird, but when you feel him."

This is in line with the practice of those who are judging for egg production. Hogan's system of a big abdomen and thin pelvic bones is being relegated by the professors in the agricultural colleges. Their objection is that the shorter the keel bone, the bigger the abdomen; and Hoganizing leads to breeding shorter and shorter breast bones and a fuller and fuller abdomen, that, lacking support of the keel bone, may sag and bag; and the professors object to the thin bone test, as this indicates the absence of fat, since the thickness of the pin bones vary with the fat and condition of the hen. But, width from the hips back, is an indication of breadth in the posterior section, which is not only valuable in a show fowl since it provides a broad base for the sweep to tail, but it is valuable in the egg type.

Some day judges will examine the body lines of a bird by handling it, not merely looking at the specimen, feather and all—just as the professors on the one hand, and Frank Gloeckl, the breeder, do now. In handling the first Chicago cock, Mr. Gloeckl said:

"He is straight back from the hips, and then he has another good measurement, he is deep when you lay your thumb on his hip bone and span his side with your index finger to his keel bone. He is what I call a square bird. Six inches across his shoulders; six inches across his hips; and six inches from his hip bone, over his side, to keel bone just back of legs. That last measurement gives you the big barrel for egg capacity.

"One more thing: I want these birds to be square across their shoulders and hips, not round. I want strength. You can't get a full breast without square shoulders, and you can't get a strong male without strong shoulders and a full chest."

As to the weights of Leghorns, Mr. Sciarri said: "We have no objection to a heavier schedule of Standard weights, but we have not been active in the matter because we thought that it might handicap some of the other breeders."

It will be of interest to set down the weights of a few of the birds as Mr. Gloeckl put them on the scales. First Chicago cock 5 lbs., 12 oz., June 1st. When in winter show condition, easily 1 pound heavier. Hen, 5 lbs., 4 oz. Third pullet Chicago show, 4 lbs., 12 oz. Another pullet, 4 lbs., 10 oz.

"The first Chicago cock is the sire of the pullet that you just weighed at 4 lbs., 12 oz.," said Mr. Gloeckl. "You must have a 6 lb. cock to produce a 4 lb. pullet. Now, I am not going to insist on raising the Leghorn weights ½ lb. all around, but I plan to say to the convention that unless this is done, it will be advisable to disqualify birds that are more than ½ lb. under weight. In other words, if a 3½ lb. pullet is to remain Standard, then in the name of common sense, don't go below 3 lbs. with your prize ribbons after the weights are applicable, which is December 1st of each year. If men want canary birds, let them breed them. White Leghorns are a breed

How Buckeye Profits Grow

On June 20, 1921, C. A. Norman of Knoxville, Tennessee, wrote us the following letter. Since that time he has doubled the original egg capacity of his hatchery and will treble it within another month. His incubators are all Buckeye Mammoth, No. 7:

"We have had much favorable comment upon the uniformly high quality of our chicks this season, and am glad to give the Buckeye number 7's their just share of the praise. The simplicity and ease of operating this incubator is especially noteworthy, as is also the maintenance of an even temperature.

"We are handling from 4,600 to 5,200 chicks each week from our two machines, which we consider excellent hatching, since about 40% of these are large breeds. What appeals to me is the fact that we are incubating nearly 21,000 eggs, with an expenditure of about thirty minutes' time daily, and at a cost of about eight cents per hour. The fans have been in continuous operation for five months without a moment's attention and are apparently as good as ever.

"We have had a profitable season, and, if conditions warrant, we expect to increase our capacity by the addition of two more of your No. 7 Mammoths."

(Signed) C. A. NORMAN

Buckeye *mammoth* *incubators*

Buckeye *mammoth incubators*

Among the more than 800 commercial hatcheries using Buckeye Mammoth Incubators there is not a single instance of anything but marked success and profitable growth.

The commercial hatchery is the newest of the great industries, and the Buckeye Mammoth, the real business incubator, absolutely takes the speculative element out of it and puts it on a sound business basis—by delivering unfailingly the highest average hatch of strong, healthy chicks.

Whether your hatchery is north, south, east or west, no matter what the temperature or atmospheric conditions, the Buckeye Mammoth will give you surer results and make more

money for you than you ever made before—saving half your time and labor and occupying about one-fourth the room.

The entire operation of turning the 10,368 eggs in a No. 7 Buckeye Mammoth requires less than five minutes' time.

Ask the Buckeye User—he knows. He can virtually “count his chickens before they’re hatched”—for he *knows* within one to five per cent what his hatch will be. And he *knows* that he won’t lose one-half of one per cent in shipping.

We will be glad to send our Buckeye Mammoth Catalog, which tells all about this remarkable invention. Let us show you how to start small and grow big in the commercial hatchery business.

THE BUCKEYE INCUBATOR COMPANY
911 Euclid Avenue, Springfield, Ohio

World's Largest Manufacturers of Incubators and Brooders

Buckeye Mammoth Incubator No. 7

Capacity—10,368 eggs held in 108 turning trays. This capacity does not include the 36 hatching trays. All trays equipped with convenient card holders which make record keeping easy.

Size—Eight feet six inches square; height, seven feet three inches.

Weight—6,800 pounds, crated.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½-inch cast iron pipe.

Electric Fans—Four ball-bearing fans, specially constructed for incubator service.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two certified thermometers, specially constructed for Buckeye Mammoth Incubators.

Thermostat—Specially constructed to provide the highest efficiency in temperature control. Solid brass hardware used on Buckeye Incubators exclusively.

Buckeye Mammoth Incubator No. 8

Capacity—4,600 eggs, 48 turning trays with a capacity of 96 eggs each and 16 additional hatching trays. All trays equipped with convenient card holders which make record keeping easy.

Size—Five by eight feet; height, five and a half feet.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½-inch cast iron pipe.

Electric Fans—Two ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers and Thermostat—As in No. 7.

Buckeye Mammoth Incubator No. 6

Capacity—2,440 eggs. Twenty egg trays, with a capacity of 122 eggs each. One extra tray for egg turning.

Size—Five feet square; 32 inches deep. Legs eighteen inches high.

Weight—850 pounds, crated.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1-inch cast iron pipe.

Electric Fans—Two 9-inch ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two specially constructed thermometers.

30 TIMES AROUND
The WORLD

A Great Egg Belt

— 30 times around the world!

Laid end to end, the eggs produced by the American Hen in the past year would circle the globe 30 times, and then have enough left over for about half a billion breakfasts.

Prominent in the ranks of these feathered producers is a breed long famous for a high and consistent egg-production — Sheppard's Famous Anconas. Time and again they have proven themselves World Beaters, topping every record. "Famous" Anconas lead the field in both individual and flock production. 339 eggs in one year, due high mark for a single hen, has never been officially equalled by any breed. 265 eggs from a flock is a record that has never been even closely approached.

"Famous" Anconas have a firm grip on both these high altitude records—and their position on the top o' the world has been won, and maintained, by virtue of their consistent performance.

It takes 100 pages in my catalog to tell the "Famous" story—eggs, economy, prizes, hardness, beauty—everything you want to know about this wonderful breed of beautiful birds. Drop me a card.

H. CECIL SHEPPARD
Box 511 BERE, OHIO
President International Ancona Club

and butter fowl. Men make their living out of them, and a pullet less than 3 lbs. on December 1st is not entitled to feed and lodging in a laying house. Then why should a judge be permitted to go along the aisle and decorate her with a ribbon in the show room? The exhibition bird must always represent the most useful and productive type. That is what I am breeding with such success as a combination of work and ambition will achieve."

This isn't a fancy chicken farm, or an egg farm. It is a breeding establishment. But there is no difference in the capacity of the females to produce eggs. There is nothing to justify the proposition that there should be one class for Standard exhibition White Leghorns, and another class, a so-called production class, for the birds of the commercial egg farm. In no essential are the birds of good breeding deficient.

Demonstration Poultry Farms.

The agricultural colleges of the different states, devoted to study, teaching and investigation, have promoted a new interest in the science of agriculture.

These institutions of learning are now going farther than simply teaching resident students. They are carrying the fruits of their work to the fathers and brothers and mothers at home on the job in the country. In extending their work, by personally presenting it to farmers through extension men, the state colleges are broadening the interest in modern, scientific methods of production, and they are contributing directly to the welfare of producers.

One of the most notable pieces of extension work being done in poultry, is being carried on by T. S. Townsley of the Missouri College of Agriculture. H. L. Kempster is the professor in charge of the poultry work at the state college, but Mr. Townsley, who carries the fruits of that work to the people of the state, has also been granted a full professorship. We believe it the first time in the history of the world that a man has been made an Extension Professor of Poultry Husbandry. Why not? The university is judged by the type of men who represent it, who come out into the field proffering knowledge gained from the laboratory and the experiment plant. Whether it is a state institution to which taxes will be ungrudgingly paid, whether it is an institution to which fathers and mothers will faithfully entrust the most precious possessions of their lives—their boys and girls—will be largely determined by the impression left by the men who come out from the university. Willingly or not, every extension man is a traveling advertisement of the house he represents. It is important that he should be an instructor of the highest type, and it is equally important that he should receive adequate recognition from the college that employs him.

Prof. Townsley's line of attack is not in making speeches, in one night stands, over the state. He is close to the fellow who has hen manure on his boots. In some sixty counties in Missouri, he has, or is establishing demonstration farms. During the past year there were 400 of these farms, and this number will be increased to about 800 the coming year. These farms are owned by progressive Missouri people who want to put into their every-day poultry operations, the recommendations of the poultry department of the State University. In doing so they become a demonstration to the other people in their community of what can be accomplished with hens by following out common, scientific practices.

The 800 farms will represent approximately 100,000 hens. Last year the average flock was 140 hens, which reduced to about 125 head over the entire year. Each farm hatched about 400 chicks, and grew about 300 on the average.

Each of these farms make a monthly report to Professor Townsley, giving the number of hens on hand, eggs gathered, stock sold and eaten, feed consumption at market prices, miscellaneous expenses, receipts, etc. The minimum profits on the Missouri demonstration farms last year were about \$1 per hen; a few farms went that low; while the maximum profits ran up to \$1500 net in the case of Mrs. Miller, who kept 400 hens. The average of all the demonstration farms was \$2.75 profit per hen.

Demonstration farm owners who secure a production of not less than 25 eggs per bird during the four winter months of November, December, January and February, are eligible for certified breeding. (Not 25 eggs per month, but a total of 25 eggs

in the four months). The purpose of these certified breeding farms is to make good breeding stock available in the different communities.

Either Professor Townsley or Assistant Professor H. L. Shrader, select the breeding hens on these farms. First of all, they must be purebred; then come the factors of size, type, color, health and external indications of heavy production. The birds must be free from Standard disqualifications, such as side sprigs, stubbs, white in face of Leghorn cockerels, etc. In selecting these breeding hens, Mr. Townsley has found that he can certify from 25 to 33 per cent of the hens handled on most of the demonstration farms that qualify with their 25 egg winter record.

The hens selected must be mated to cocks or cockerels that are sons of hens that have records of 200 eggs or better. These males, too, must be purebred and free from disqualifications. The college itself, supplies at prices up to \$10, a large number of the White Leghorn cockerels. The college has sixty 200-egg hens in its White Leghorn flock, and hatches all the chicks it can from them.

We looked over this White Leghorn flock at the Missouri State College. It represents good quality. Not a brassy male in the lot, and both cocks and hens showed good breeding along the lines of the Standard of Perfection. The college has been breeding to the Standard 4 lb. hen, but Professor Townsley said that hens that lay the best would weight 4½ lbs. when in good flesh in the winter show season; and the pullets would run pretty close to 4 lbs. Said he: "There isn't more than a half pound difference between our pullets and hens. We try to get our pullets as fat as mud before they come into lay so they will not go into a fall molt. It makes them nearly as big as hens."

The certified farms that employ the 200-egg bred cockerels agree to mate them to the hens that were selected and do all their hatching from these matings. There will be about 100 certified breeding flocks this year. While there has been no scarcity of 200-egg-bred White Leghorn cockerels to serve these farms, Professor Townsley has had difficulty in getting honest-to-goodness pedigreed males from 200 egg hens in Brown Leghorns, Barred and White Rocks, S. C. Rhode Island Reds, White Wyandottes and Buff Orpingtons. He simply has no single certified flock of Rose Comb Reds for he has never been able to find a 200-egg-bred rooster to head it. "That is the greatest problem," says he, "to get 200 egg cockerels of good Standard quality. In fact, we can't get enough pedigreed males of any quality but we really prefer good Standard quality when we can get it. We insist, of course, on individual pedigree, not pen pedigree; we want to specifically know what the dam actually did in the way of egg production, and if possible something of what is behind the dam."

After mating the birds on the certified farms, and to finish the work, Professor Townsley goes back in the summer to pick out the early maturing, good typed, broad backed, good colored cockerels. He bands these in the wing and certifies them. Last year he certified 800 cockerels out of 4,000, roughly speaking, that he handled.

These cockerels are then sold to local poultry keepers for the purpose of improving and re-inforcing their flocks. The owners get about \$5 each for them, but in some cases farmers take 5 to 10 of the males, in which event sellers may cut the price. The cockerels sold last year by the farmers to other farmers averaged \$4.40 each.

The wing band that Mr. Townsley has sealed is an assurance to the local buyer that he is getting a well bred bird. The bands are numbered, and a certificate signed jointly by a representative of the college and the seller, goes with the bird. These "papers" assure the breeding, health and quality of the bird, and there are farm poultry keeper in Missouri who are already asking for "cockerels with papers." To date the certified farms have found a satisfactory outlet for their males for stock purposes.

This is not only a breeding project. The college advocates systems of correct housing and methods of correct feeding and rearing. The demonstration and certified farms are actual illustrations in every day life of what can be accomplished with poultry by employing good methods. Of course, better stock in those good houses, better stock to receive that good feed and on which to bestow that good care, naturally go hand in hand.

That breeding counts, that extra well bred stock is worth while is demonstrated

HAZELRIGG, IND.

by the fact that the pullets on the certified farms, where only 200 egg bred males were employed, laid 30 eggs during the four winter months, whereas the pullets on demonstration farms averaged 24 winter eggs. That is an increase of 25 per cent for the certified farms, and it appears that it should be attributed largely to the blood, the breeding, for all the farms feed the same.

What Townsley is doing, is being duplicated by Phillips and Jones in Indiana, by Rice and his co-workers in New York, by Kirkpatrick and Jones in Connecticut.

One word, the magic word of Opportunity, sticks out in every story of these demonstration farms. Opportunity to make more money by employing better methods.

Poultry, agriculture, fruit production are all pretty much organized on the basis of low efficiency. So are most businesses. Go into a department store. Sales girls are looking at themselves in a mirror and poking pins in their hair, and earning \$18 a week instead of \$25.

Here and there are ambition and willingness to work coupled up in an individual. He increases his efficiency. He gets ahead in life.

Down in the Ozarks of Missouri you can hire a farm hand for \$30 a month. A poultry keeper in the same section of nature's out-of-doors made \$46 net in the month of April from his hens. He sold the eggs at back-woods prices to local buyers. He couldn't have made that much money by hiring out at stiff labor for the entire month. Do you realize what two twenty dollar bills, a five, and a one, mean to people in some parts of our country?

That farmer in the Ozarks had arrived as a farmer, but many a man who has arrived needs stimulation, new help, a fresh outlook. The Missouri College of Agriculture through its extension service, furnished the inspiration to do the old job of poultry keeping in a new and better way.

All about us lie opportunities. The world is organized on the basis on the average human being. Here and there a man climbs above that average.

The Red Color Question.

Professor T. S. Townsley gives it as his opinion that the red color problem is working against the popularity of the Raode Island Reds on the farms of Missouri. That will be news to those who imagine farmers as interested only in pounds of meat and dozens of eggs. Fact is, farmers know something about breed character in all classes of domestic animals—and a rich bay horse still brings more than a washed out gray one.

It is probable that there will always be some off colored farm flocks of Reds, for every chicken raiser cannot become a chicken breeder. But, breeders of this popular variety are becoming more numerous all the while. The sources of good seed stock at farmers' prices are more numerous than ever before. The variety is unmistakably going forward.

There are problems in connection with this red color question that are of interest to breeders, and a little talk on the subject with the President of the Rhode Island Red Club of America, should be of especial interest at this season of the year when the young birds are beginning to show the wisdom or error of matings made earlier in the season. Said Mrs. E. W. Mahood, President of the club, at the time of our recent visit to the home of Mr. and Mrs. Mahood:

"I used to urge balancing the matings. That is a popular theme with many of those who write articles today. Experience has shown me that in some cases this advice is carried too far. If you have a good cock and two good hens, also a fair cockerel and four fair pullets, it is not advisable to mate that good cock to the four fair pullets, and the fair cockerel to the two good hens, in order to strike a balance. Such matings produce mediocre young stock. It would be better to mate the good cock to the two good hens and do your rearing from this trio.

"The same thing holds good in selecting birds for different points, such as head, color, shape, size, etc. It is not advisable to balance every thing in the flock. It is often advisable to hold some things, by selecting both males and females that possess those things. This may result in having more birds left over after your matings are made. The balancing program would utilize about every bird, but it is not always advisable to balance everything.

You Can Easily Turn 10,200 Eggs at One Time Without Jarring or Cracking—

CANDEE

HERE is a perfect, unfailing Egg Turner, free from cogs or gears. Moving a master lever turns the eggs more gently than the touch of the human hand. All of the eggs in every tray—whether full or partly full—are turned at one time.

It takes only an instant to disconnect any tray (see pictures below). No tray space is wasted. Trays are easily and quickly cleaned after a hatch.

Vital Features of The 1923 Model Candee

Double Heat Control—Automatic regulation of heater drafts and automatic control of hot water supply for each 300-egg compartment.

Truly Sectional—Each section contains two 300-egg compartments and is shipped ready to set on the legs. Extra sections can be added any time later.

Built To Last For Years—Not only handsome in appearance, but solid and enduring with proper ventilation.

Easy to Operate—It only takes a few minutes daily to tend a Candee. Eggs are cooled in the machine.

Set It Up Yourself—A Candee arrives all built and no previous experience is necessary to set up a Candee.

Candee Capacities—A one-section (two 300-egg compartments) is the smallest Candee made. From that size Candees range upward to 10,200 with one heater. Installations are made in single or double deck and any capacity from 600-eggs up can be supplied.

Hen and Duck Machines—Candees are equally successful with hen eggs or duck eggs. For exclusive duck work, larger trays are supplied.

Send for Catalogue—Write for catalog and description of the Candee Automatic Egg Turner, which will be sent free upon request. It tells of the thousands of successful Candee users of Incubators, Hot Water Brooding Systems and Candee Colony Brooders.

Dr. David Roberts Poultry Tablets

A combination of sulphocarbolates of calcium, sodium and zinc for the treatment and prevention of White Diarrhea and all intestinal infections of baby chicks, as well as poultry in all stages of life and productivity. Drinking water for poultry should be medicated to overcome and prevent disease. The annual poultry loss by disease is stupendous—over 50 per cent.

Save Your Chicks

Serve in fresh water. Aids digestion. Permits food to nourish them through their babyhood, the non-productive period when hardy bone and strong muscle is needed to give them a good start in their race for the laying period. They will reward you manyfold later on. Give them proper protection and you will find there is big money in poultry. Sold in tablet form.

50 Tablets 50 Cents

Poultry will drink when too sick to eat. Baby chick organs are peculiarly sensitive. They need something to ward off disease, particularly that most dreaded and destructive disease white diarrhea.

A Tablet A Day Keeps Disease Away

One package, 50 tablets, enough to medicate 50 gallons of water, a most effective and economical preventive, for only one cent a gallon. Use Dr. David Roberts Poultry Tonic, Louse Powder, Poultry Cholera Medicine, Poultry Roup Paste and Disinfectant, all known and tried prescriptions. Sold by our druggist, dealer, or direct.

Dr. David Roberts Practical Home Veterinarian, a veterinary doctor book, regular price \$1.00, tells you how to treat your own poultry, also describes our 44 prescriptions—a prescription for every animal ailment. We will tell you how to get it FREE.

Our Special Introductory Offer

Send 25 cents, just one-half the regular price, for one package Dr. David Roberts Poultry Tablets, sent you postpaid, providing you give us the name of your druggist or dealer.

"Hold some things as near 100 per cent good on both sides as possible. The result will be that you will establish those things, and then you can go on establishing other things. If you spread out too far, and aim for too many things in one mating the problem of selection may become so difficult that any real and lasting progress will not be made.

"The breast is an important section in the male. It exerts a great influence in producing the right kind of color in your pullets. Ben Scranton bred good breasts. He established that quality. His females were wonderful—the best of their day.

"Our strain of Reds traces back to the old Lester Tompkins stock. The females of that line, as we had them years ago, had black in their wing bows and lower breast. We secured a Single Comb cockerel and bred him on those females. From that mating we grew a red winged male. That male was then bred on some big females that we had produced by making a pure Ben Scranton mating. That was the origin and foundation of our strain.

"I am no longer afraid of breeding on the dark side. A soft red male should be mated to a female that has a bar of smut in her back.

"A red winged male is valuable. He can be used with a female that has ticking on wing bows and lower breast. He will absorb this excess black.

"In breeding Reds, we must use some excess color. It is not merely a matter of blending shades or tones of red (as in buffs) but a matter of feeding or re-inforcing red. You can intensify the shade of undercolor by using slate.

"I know that you admire the smooth, round, well webbed out feathers in our females, and their rich color. That is due partly to health. I fancy that a smooth feather shows better vigor than a stringy feather. But, the color and quality of feather in our females is due largely to the deep red breasts of the males we breed.

"On the other side, dark, rich neck plumage is essential in the females, especially if you hope to produce good colored males. Anyone not familiar with shades of red color found in this breed, should study the necks of females, observing not only the undercolor but the tone of color in the edges of those female neck feathers. Only after absolutely knowing what a dark neck in a female is, can one select good cockerel breeders."

In the matter of breast color in males, we can attest to what has sometimes been described as a richness and brilliancy that must be seen to be fully appreciated. We had always supposed that a Rhode Island Red male should have a red breast, but in judging at the Washington, D. C. show, some seven or eight years ago, we ran onto a line of Reds, shown by a Mr. White of Maryland, that not only won all the prizes, but distinctly contributed to our education. Such redness of breasts we had never seen before, or if we had seen it, it had not soaked in upon our mind. During the week we met Mr. White. He explained the origin of that good color by saying that the year before, he had sent \$50 to Ben Scranton for a sitting of eggs. In passing please note that price for a sitting of eggs. It was paid before the war inflation. It was a price based on good quality in the old days.

Continuing on the subject of Reds, Mrs. Mahood said:

"We sometimes use a brown bird in our breeding pens. That is a stringy feathered bird. I don't like it, but just as a painter may use brown pigment to help in producing a certain shade of red, we may find it useful occasionally to use a brown bird. It is somewhat easier to get deep undercolor in such a feather, but the ideal red female has a smoother, harder feather, with good width of web.

"There is considerable talk about the exact shade of color. Birds that are winning today are of a dark, rich red, one even shade of color all over, with depth and soundness of undercolor, and a life or brilliancy to the surface color. Some writers say that the surface color is important. That is true. But in selecting birds that will produce surface color, the undercolor must not be overlooked.

"White in undercolor is the greatest fault in a breeding bird. It is sometimes due to poor condition. You can tell whether it is caused by lack of condition or is hereditary, by pulling out the feathers that show white and allowing them to grow in under conditions favorable to normal feather growth.

"The undercolor of the hackle and the sides of body are what I call revealing sections. If a male is strong in these two

sections and free from white, he will be likely to produce good colored chickens. These sections are especially revealing when choosing hens for the breeding yard, for old females often lose much of their color when they molt. If still strong in red at the base of their feathers on neck and sides of body, it is pretty safe to assume that they have color-breeding strength.

"In surface color, I would put breast and wing flights first. I do not refer to black in primaries but the richness of the red in breast and wing flights. I consider breast even more important in a breeding male than hackle. A good many 12-week old pullets have good color right now, and will carry it through their chick feather stage, and by October, as they grow their final chicken plumage, they will appear faded or mottled in breast color. Again, a female showing good breast color as a pullet, if she fades in any section as a hen, will fade in breast. I want a male rich in breast, free from shafting, and the lower breast feathers, where breast and body join, the same good red. Such a male will do much to stamp the deep stay-red in his female progeny.

"The hackle section can be quickly improved by using females with dark hackles. Of course, neck is important, in the female as a breeding proposition; in the male because it is part of his top plumage, and a neck that is lighter in color than back and saddle, makes a two colored bird. There is danger of trying to get rid of black in the hackle by letting the red color of the neck run out. A male with a dark neck and some black is preferable to a yellow neck free from black. No question about that. Some chicks that show black in neck, and some cocks that molt in a summer hackle that carries black, clean up at show time.

"I would not discard a good bird because of a little pepper on wing bows or a little black in lower breast. Not splashes of black, but a little can slip through. Such ticking does not mar the beauty of a bird, for it is not discernable when the bird stands ten feet away from you in the run. These birds are often the strongest color breeders. Simply be careful to give them mates that are redder rather than blacker in neck and wing flights, with no black ticking in surface and no slate in undercolor. There you have it—a red winged male fitting in with a color-feeding female.

"None of us have perfect birds with which to work. The wise beginner does not work with material considerably below the level of other breeders, but there isn't such a thing as a perfect mating composed of a perfect pair. If you have too much black in neck, breed a redder winged, a redder tailed mate to correct the tendency to a blackish hackle, but don't go to balancing by breeding a lemon necked mate. Hold your dark hackle; clean up your excess of black in the hackle by breeding a mate that has less black pigment in her.

"In the reverse operation that of introducing excess color, there is no rule covering just when and how much. Some families will absorb more than others. I would say every third generation. That mating would be something like this: A soft breasted male on a bar of slate; or, if the male showed little or no black in wing flights and no excess black anywhere, I would select females with as much black in tail as possible, some black in flights, good strength of undercolor, and I would not discard good females that showed a little pepper in wing bows and breast unless fortunate enough to have birds in sufficient numbers that were strong enough in every section.

"That is how you feed color. It is the same as in other parti-colored varieties. It isn't a case of breeding poor birds to produce good ones. It is a case of using birds of the best possible breeding, but selecting them and using them in accordance with established natural laws of breeding. I do not say this to bolster up the price of excess colored culls. I wouldn't give over market price for a red hen of no breeding because she had black cropping out in her surface plumage, but I have retained excess colored birds on which I placed a value of a hundred and a quarter.

"Perhaps this statement on breeding is somewhat at variance with the ideas held by new breeders. I shall be very glad if my experience can be of help to them. It isn't chart breeding that I recommend. The only way to breed is to have the quality you want close up in the ancestry of the actual specimens you mate. Then mate those birds along the lines that experience of successful breeders has shown to be correct."

Prices of strong, pure-bred baby chix for July. Barred and White Rox, R. C. and S. C. Rhode Island Reds, Buff Orpingtons and White Wyandottes \$12.00 per hundred; \$6.50 for 50; \$3.50 for 25.

CURRENT NOTES AND COMMENT

Another Holiday

Fourth of July is near at hand. On the last national holiday, Decoration Day, some people laid flowers on the final resting places of soldiers, relatives and friends, while others gave the day to auto races, sports and cock fighting. Near Springfield, Mass., a hundred men were arrested, 100 pit game cocks were seized, and the cock fighting derby of Massachusetts and Connecticut was brought to an abrupt end. On the same day, May 30, near Rochester, N. Y., 132 arrests were made and 85 game cocks were captured by state troopers at a cocking main. Will the "symbols of American gameness," with steel gaffs buckled on, fight it out with the ferociousness of the jungle fowl, on July fourth? Isn't it time that this brutal sport should be supplanted by modern, scientific breeding of chickens?

Shouldn't the docile breeds of hens that open the fountain springs of their nature to produce human food in abundance, totally supplant the pit fowl of cruel, fierce, savage nature?

* * *

Mr. Angell In New Position

Albert Angell, Jr., has accepted the position as head of the poultry feed department of Rosenbaum Bros. This firm has been established in the grain business for 53 years, and is one of the largest cash buyers of grain on the Chicago Board of Trade. The resources of this firm are thus combined with Mr. Angell's well established ability to formulate feeds for growing chickens and for securing eggs.

* * *

The Judging Stick

D. Lincoln Orr pays his compliments to the judging stick, as follows:

"We are wondering if using the judge's stick as an aid to find out which is the best bird or birds, is a good thing. There is no question in our minds that the use of the judge's stick often does more harm than good.

"Birds are more or less nervous even if they have been trained to a certain extent by the stick at home. By the time they get to the show they are worked up and in their upset condition along comes a fellow poking at them with a stick. To be sure, the stick looks something like the one at home but the fellow handling it is different

and the poor bird has to pose when it is just about scared stiff. We feel the judge's stick should be abolished. A little chirp, a few words and a gentle stroke of the hand, in our opinion, will do more good than anything a stick can accomplish. It is rare indeed that the right judge cannot soothe and calm the most nervous bird in a few minutes, sufficient to pass judgment; if not, then there is no use calling on the judge's stick for help."

If Mr. Orr would abolish the stick (except in the case of pens), in the judging of all varieties other than hard feathered kinds, such as game bantams, he would contribute to the peace of mind of exhibitors in those anxious days of conditioning prior to the show.

* * *

Specialty Clubs to Combine

We are requested by A. F. Rolf, temporary secretary of the Federation of American Specialty Clubs, to make the following announcement, which is directed to all specialty breed clubs:

"The President, Secretary, and all other officers of all the specialty clubs of the United States and Canada are urged to attend a meeting to be held in Knoxville, Tennessee, August 6th and 7th, to consider and act upon the proposed Federation of American Specialty Clubs, and to formulate a program of action to be followed in the convention of the American Poultry Association, in the same city, August 8 to 12. All specialty club members will be welcome."

* * *

An English Judge

There have been American poultry judges who have considerably exalted themselves and exaggerated the power of their positions, but never have we heard of anything coming from an American judge equal to the remark attributed to C. A. House, the Englishman who is making a judging tour in Australia. When questioned about one of his decisions not being in accordance with the Standard, Mr. House had the brass to say: "Standards are compiled to guide breeders, but not to handicap or hamper judges in their work."

In commenting on this candid outburst of egotism, a contributor to "Poultry," Australia, writes:

"What is the value of a Standard to a fancier if it is thrown to the winds by a judge? When a man undertakes to judge poultry he should place himself in the same position as one who administers the law, i. e., place all personal tastes and prejudices on one side, and endeavor to strictly interpret the letter and spirit of the Standard."

* * *

Summer Egg Prices

Egg prices may go to pot this summer. Some big dealers think so. It will not be the first time. Remember the big stocks these dealers have in storage. They went into the refrigerator rooms at \$.03 a dozen more than had calculated among themselves to pay. They will come out in October, November and December at cost prices plus cost of carrying and that indispensable profit necessary to the life of the egg dealer's business. The wise poultry keeper wiggles through the dog days with hens in molt, young pullets growing, for he is organizing to produce fresh eggs in the high price months of November and December.

* * *

Will Apply for Patent

One breeder who is working on a new breed that is distinctive, writes us that he is going to inquire into the possibilities of copyrighting the name, so that some new variety cannot eventually come along and trade on the established breed name. He evidently has in mind the making of a white variety by cross breeding and calling it a member of the Rhode Island Red breed.

After all, the R. I. White fellows are not to blame. The Standard has always said that shape made the breed, so it naturally was expected that a new variety with the necessary shape requisites should be joined up as a member of the breed.

When Nature Fails WHAT THEN?

BASIC FEEDS FOR POULTRY

Nature's program is such that the late hatched chick is placed at a decided disadvantage over early hatched birds.

Springtime is the ideal growing period—that's when nature furnishes a generous supply of tender bugs and grasses. The late hatched chick is not so fortunate, the bugs and tender grasses are not so plentiful, therefore the growth of the late hatched chick is usually slow and disappointing. Special food only will overcome this condition and we have come to the aid of our patrons by supplying just the feed that best meets this condition. It is our

502 Developing Wet Mash

Composed of choice Rolled Oats, Corn Meal, Wheat Middlings, Dried Buttermilk and Meat Scraps it abundantly supplies the food qualities that promote rapid healthy growth. Feed our 502 DEVELOPING WET MASH to all young stock once a day. That is our recommendation—the result of careful and extensive feed experiments—we know it is the ideal feed and we back it up with our "money back" guarantee. Give it a trial.

SPLENDID GROWING CHIX. 12 weeks old from choicest Coliseum winners at \$4.25 each, 4 for \$16.00, 12 for \$45.00. Same magnificent quality in 4 month chix at \$5.00 each, 4 for \$19.00, 12 for \$55.00. A liberal selection and complete satisfaction assured by our approval and C. O. D. proposition.

THORNTOWN, INDIANA

Silver Campines

Green Sheen Strain

I HAVE 400 Campine chicks, the oldest about five months. They are the biggest bodied, best maturing lot I have ever had. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have

been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

Mr. Orr's Offer

Announcement was made in April issue that two young poultry judges who had shown aptitude for poultry judging, would have their railway and pullman fare paid to the forthcoming New York show by the Madison Square Garden poultry association.

Secretary Orr has received several letters from young judges who would like to make this trip. The selection of the two candidates will be made later. In the meantime, Mr. Orr has had a set of questions printed to enable him to pick the right kind of young judges, those who have a capacity and fitness for the profession and a readiness in learning. Men who have never judged are not eligible neither are those who do not plan to continue actively in the judging business.

Blanks on which to make application for this trip to the New York show, are now available and can be secured by addressing D. Lincoln Orr, Orrs Mills, New York.

* * *

To Inform the Exhibitor

On page 474, April issue, was illustrated a report card that is to be filled out by the judges at the forthcoming National Poultry Show, Chicago, and promptly mailed to exhibitors. The New York show has also adopted a report card to be immediately mailed to exhibitors, giving the awards on each bird entered by the exhibitor; also advising the number of birds in competition against the exhibitor.

Both the Chicago National and Garden Shows have thus found a means of giving rapid-fire service to exhibitors unable to be present at the show. That is putting the "punch" in service.

* * *

Eggs in Storage

Cases of eggs in storage at the four principal terminals of New York, Boston, Philadelphia and Chicago, June 15, 1922, totaled 4,234,537 against a storage supply of 3,312,629 cases on the corresponding day of 1921. Buying eggs against probable consumption during the winter season is a speculative business. Occasionally holders get an over supply and have a disastrous tail-end season. Weather has a great bearing on the market. Last winter was an open winter and storage stocks were not too heavy. If this winter is a cold, severe one, the heavy stocks will probably move satisfactorily into trade channels. However, with present stocks, buyers are not "bidding up" summer eggs. Receipts of eggs at the four principal markets from Jan. 1, to June 15, 1922, were 9,778,772 cases, about an 8 per cent increase over receipts for the same period of 1920. Stimulated interest has increased production on farms.

* * *

Cock Growing

A legal case has been tried in the English courts to determine whether cock crowing on a large poultry farm is a nuisance to nearby residents. The farm in question was that of W. H. Cook whom the plaintiff sought to restrain from carrying on his poultry farm. A large amount of evidence was taken on both sides, and the judge decided that plaintiff had not established his case and the action was dismissed with costs. The judge held, however, that the business is one which might become a nuisance by noise, in which case a resident has good cause for action.

M. R. Knox Passes Away

Marshall R. Knox, Downers Grove, Ill., passed away suddenly, May 30th, after a short illness. For a number of years he had been an ardent fancier of Blue Andalusians, and while he had kept some Reds, it was only last year that he went into them in a major way. He had planned on showing Reds at the Chicago Coliseum this December. Mr. Knox was 41 years of age. He will be missed by a large number of friends in the poultry fraternity.

MILLER'S IDEAL Mammoth Incubators

My Greatest Achievement—By J. W. Miller

PEACOCK'S POULTRY YARDS

EXCLUSIVE BREEDERS OF
S. C. WHITE LEGHORNS
HATCHING EGGS AND BABY CHICKS
WINNEBAGO, ILLINOIS.

June 8, 1922.

J. W. Miller Co.,
Rockford, Ill.

Dear Sirs:

Results obtained with our Miller Ideal Mammoth Incubator, have certainly been gratifying. We can truly say that it will hatch every chick that it is possible to hatch, and can recommend it without hesitation as holding a position above reproach in hatching good, strong, healthy, livable chicks—and lots of them.

For five consecutive settings, from eggs after the 14th day test, the average hatch was better than 90%. This is typical of the results obtained during the whole season.

We have been so well pleased with the Ideal Mammoth Incubator that we have, that we hope the new 10,200 egg Ideal that we have just ordered may be installed and ready for operation in due time for our next season's business.

Yours very respectfully,
PEACOCK'S POULTRY
YARDS,
T. W. Peacock.

Yes, I have produced something entirely different in Mammoth Incubator construction—the machine that you have waited years to own, and I've worked years to build.

Here it is—new in design; new in work and time-saving features; new in economy devices; new in greater dependability, and a proved success in the hands of prominent poultry men owners all over the country.

Its unit form of construction allows you to start hatches on any scale desired and add more units as your business grows. Its improved scientific heat distribution, dependable ventilation, moisture equipment, safe and convenient turning of eggs, all put certainty into hatches.

Even the details, such as stronger, more firmly braced egg trays, square to permit turning, with removable screens, and removable nursery bottoms for easy cleaning mean ease and convenience. It is the ideal producer of strong fluffy chicks—and it produces them at the lowest cost ever known.

You will want one of these machines at once. The difference in its lower cost of producing chicks means too much in your increased profits to overlook. I unhesitatingly back it with my strongest guarantee. It is the achievement of a life work. Write and let me send you my new catalog telling more about it.

Special inducements for early orders. If in a hurry wire.

J. W. MILLER CO., Box 2, Rockford, Ill.

A 2-month-old cockerel a few hours after being attacked by head and neck lice. Both baby chicks and grown fowls are killed in great numbers by this type of louse.

Mineralized Water Routs Chicken Lice

A new scientific discovery makes it easy to rid poultry of lice and mites. Simply dissolve in the fowls' drinking water the harmless mineral tablets known as Paratabs. Soon after the fowls drink the mineralized water, all lice and mites leave them. Chicks that drink the water never will be troubled by vermin.

The body louse of chickens

Paratabs do away with the bother of greasing, dusting, spraying and other unsuccessful methods of fighting lice. They are warranted to impart no odor to flesh or eggs. They cost only a trifle and are sold under a money-back guarantee. Thousands of poultry raisers are using them with complete success.

The head and neck louse of chickens

What Users Say

Paratabs are the best thing for chickens I ever used. They clean the hens and make them lay, and I don't find any lice, mites or fleas on any of my young chicks. Paratabs are a good tonic for all chickens.—MRS. W. A. G., Jacksonville, Fla.

Paratabs are fine. My chickens have no more lice. Before using Paratabs I had 20 loafers on the roosts, but now they are all out.—MRS. A. F. Keesville, N. Y.

I never saw anything like the work of Paratabs. It reminds me of the fairy story of the magic wand. Early this year I was setting 14 to 16 eggs a day. Then, without visible cause, the number dropped to 5 to 7 a day. I began using Paratabs as directed and in 2 or 3 days there was a difference of 1 or 2 eggs a day. On the fifth day, I got 17 eggs and on the seventh I got 23. I heartily recommend Paratabs.—MRS. E. H., Centralia, Illinois.

I received the Paratabs all right and my hens seem to be laying better already.—MRS. W. S. C., Monticello, Ark.

I am giving Paratabs water to my chickens and am having better luck this year than ever before. I haven't had a little chick to be a bit sick. It is the greatest medicine we ever used for young chickens.—MRS. M. N., Pulaski, Ky.

SEND NO MONEY

Let US Take All the Risk

Any one can try Paratabs without risking a penny. We are so confident this new scientific discovery will free your flock of lice and mites that, to introduce Paratabs, we will send two full \$1 packages—enough for 200 gallons of water—for only \$1.00. BUT SEND NO MONEY. On delivery, pay the postman \$1 and postage, and if your flock is not free from lice and mites in 10 days, your money will be refunded without question. Don't let vermin kill your fowls and steal your profits. Write for the Paratabs today.

PARATAB LABORATORIES
Dept. 811, 1100 Coca-Cola Bldg., Kansas City, Mo.

Breeders Are Interested in Their Standard.

(Continued from page 735)

orca and the Black Hamburg. Both carry rose combs, white ear lobes, black plumage and black shanks, but the Minorca has a larger and longer body, and no competent judge has ever been known to mistake a typical Rose Comb Black Minorca for a Black Hamburg.

There is little more that need be said. The way is then paved for the Rose Comb Rhode Island White breeders. The practical thing for these western and southern breeders to do is to poll their strength with the eastern delegation that is strong for the black birds, and vote in the Black Giant, thus breaking the barrier; and then with the same majority put in their own rose comb white variety. Remember, you fellows are organized to put these varieties in the Standard, and there is no organized opposition to keep them out. The Standard Committee is not organized against you. The Standard Committee simply tried to be faithful to its trust and render a fair, unbiased report.

The Standard Committee has done a great favor to these new varieties. Its report has aroused interest in them, secured notoriety for them, cemented together the breeders of them, and out of the community of their interests the industry will learn in no uncertain terms of a new white and a new black breed.

On the admission of Single Comb Rhode Island Whites and Rose Comb Barred Rocks, the action of the convention is very much in doubt. It begins to look like a compromise on the new breed proposition, with the Black Giants and Rose Comb Whites getting through.

Size of Leghorns.

We have entertained some doubt about size of Leghorns being increased. First, there are a great many back-lot flocks composed of small birds. All of their owners can voice their objection to an increase in weight. Second, some big breeders find it easy to grow the topky, little kind, and an increase in weights would reduce the selling price of such cockerels and pullets.

The Standard should set an ideal for breeders to shoot at, but the present system of taking a referendum vote among club members, and then insisting that the Standard be made to suit the majority, can but result in the standard not being set much ahead of the birds themselves. Again, when a breeder sends out an illustration of a five month old "White Leghorn Cockerel," that has body enough for a minorca, and then says that he favors the present Standard weights, we don't see much chance for reform.

We may be wrong in sizing up the opposition to a robust, sturdy, strong framed type of Leghorn, as the following letter from Geo. Gable, Ohio, a breeder of Buff Leghorns, indicates an appreciation on his part of size and substance. We trust the view he holds is typical of the viewpoint held by many more breeders than the vote being taken by the National S. C. White Leghorn Club, now indicates. Mr. Gable writes from personal knowledge and practical experience.

"I am very much pleased with the stand you have taken on Leghorn weights, I will admit that 3½ pounds for a Leghorn pullet is good weight and makes a good sized pullet, but I find that we have judges that are still looking for the real small birds, short and cobby, and almost a bantam; birds that would hardly tip the scales at two pounds as pullets and as hens they are altogether too small.

"I also realize that if one pound-under weight is a disqualification, instead of two pounds that this will probably help to make these old time judges place larger birds; but if the weights were increased just a little more, as the Standard Committee recommends, then I am sure that all judges and breeders alike would have to recognize the larger birds and give a 3½ pound pullet the preference she deserves. As it is, when a person shows a good pullet that is only up to Standard weight they will tell you she is too large.

"I was always for the small birds and was as sore as a boil when they put the 3½ pound weight on the Leghorn pullet in the 1919 revision of the Standard, but since then I have bred some larger birds and find them superior to the small ones. When I saw where I was wrong then I was willing to admit the fact that I was wrong.

Rogers' White Leghorns

Chicago Coliseum and Boston Winners—Guaranteed Stock at Right Prices—Catalog Free—Write! Rogers' Leghorn Farm, South Road., Elgin, Ill.

"While I still have some small birds, I also have some pullets that range in weight from 3½ pounds to 4 pounds on the scales, and I want to say that the larger birds are the best for several reasons; first, they are just as neat and refined looking, that is, when they are bred according to Standard type and qualifications; second, they lay larger eggs, 28 ounces to the dozen, and more of them, and especially in real cold weather. When it is down to zero and below, the big birds dig in the litter, turn the straw over and over, almost burying one another, and they sing as if it were the first of April; while the little birds' feathers stand on end and they stand on one foot and then the other, and hardly know whether they want to dig the grain out of the litter or not.

"When people see the bigger birds of the Standard quality in the show room, or in my yards, they notice the difference at once and make the remark, 'How does it come that those birds are so much larger than those in that pen?' Why they look like real chickens."

"You can readily see how I feel about the size of Leghorns. I am satisfied with a 3½ pound pullet; that makes a fine looking pullet; but I think that a little more weight would make some of these judges that have never gotten away from the old style Leghorn, come to time. I am writing you to let you know that I think the Standard Committee has done justice to this breed, the Leghorn."

The Cochon Standard.

There was some private discussion about the Cochon Standard. Your committee this time was a dyed-in-the-wool fancier's committee. No man wanted to injure any breed, but they all wanted to do anything within their power to bring out the good in the old breeds and give them new life, so as to attract more breeders to them. After some little discussion on Cochons, no material change was made, as it was the consensus of opinion that Cochon breeders wanted no changes and that this was correct is borne out by the following letter from an enthusiastic Cochon breeder, Theo. Faulstich, Ohio: "My attention has just been called to the fact, that there seemingly is a movement on foot to change the present Standard description for Cochons,—by reducing bulk of feathering, and have them higher on legs, etc.

"Now, whatever may be the motive for such procedure I am unable to say, and can not understand why, in the name of sound, common sense, the present Standard description should now be made to give way in favor of the undesirable features and characteristics above quoted, especially after a number of prominent breeders who like myself, have spent 25 or more years in trying to produce Cochons that conform to the present ideal, and these few breeders who also have made possible the present Standard description for Cochons. Am I not right?"

"The present Standard description is in my opinion, the 'Best Ever' and can not, nor ever will be made better, so far as a true Cochon is concerned, and I for one, shall enter a vigorous protest against any attempt to change said description in favor of the undesirable features proposed, no one of which is in harmony with a true Cochon, but more fitting for a Langshan. If we want to continue with Cochons—why not breed Cochons? If we want Cochons possessing Langshan characteristics then exclude Cochons entirely, and we will breed Langshans; but by all means, do not let us then call such birds Cochons for if we do, the Standard description embodying the foregoing Langshan characteristics, will be looked upon by Cochon breeders as an absolute farce, simply because, as I stated before,—the leggy, hard feathered bird is not in harmony with true Cochon type. Do you remember seeing Cochons possessing these undesirable features 25 or more years ago? I do in fact,—I bred Cochons at that time, and while not an old man at that, I do, however, hate to think that after spending all these long years in trying to produce Cochons which closely do approach present Standard requirements, we should now go back to breeding the style of birds we had—as above stated,—25 or more years ago.

"If the contemplated changes are designed to meet the tastes, and desires of a few critics, who haven't the knack and ability to produce a good Cochon, then I would suggest that these paltry few, better discontinue their efforts along this line, and take up the breeding of something else with which they may have greater success, rather than have the bottom knocked out of the present Standard description for a true Cochon. If, on the other hand, the proposed changes are calculated to make a

It's Easy and Pleasant Work

instead of a mean, disagreeable job, keeping your poultry-houses clean, white, light and sanitary—and the results are much better than you get from white-wash and disinfectants—if you use

CARBOLA
The Disinfecting White Paint

a white paint in powder form with which is combined a disinfectant many times stronger than pure carbolic acid. It comes in packages sized to suit your needs, and it is ready to use as soon as it is mixed with water—no waiting or straining. It can be applied with a spray pump or brush to wood, brick, stone, cement, plasterboard, or over whitewash, and it will not blister, flake or peel off. One gallon, a pound of the powder, covers 200 square feet. It has no disagreeable odor to taint milk or other food products. It is harmless to the smallest chick or to stock that licks a painted surface.

Use it Instead of Whitewash and Disinfectants in

Cellars Stables Hog Houses
Poultry Houses Outbuildings Garages, etc.

Use the dry powder as a louse powder. It's as good as any—much better than some other brands—and costs about one-third as much. Carbola is used by thousands of poultry, dairy and breeding farms and by many experiment stations and agricultural colleges. Give it a trial. You will find it saves time, labor and money. Money back if you are not satisfied.

Your hardware, seed, drug or paint dealer has Carbola or can get it. If not, order direct. Prompt shipment by post or express.

Morris' White Orpington Farm

Puts on Half Price Sale of HALF THEIR 1922 BREEDING STOCK

Our breeding season ends July 1st. We have 800 fine growing pullets and 800 cockerels, some weighing 4 lbs., the finest we ever had at this early date, May 1st. They are needing more room every week. We are offering to sell at HALF PRICE, good through July, August and September, half the females and a few of the males from our various matings, including our Special All-Star Matings, Exhibition Matings, Special Egg-Laying Matings and our General Matings. We reserve the right to refuse to sell certain individuals. This is a real opportunity to get proven combined exhibition egg-laying stock cheap. Get the female end of your foundation stock while the "getting is good" and we will supply you with the Cockerel to properly mate to them when the cockerels are sufficiently matured that we know what we are sending. Get real White Orpington blood lines at the "Home Farm" for White Orpingtons. We will satisfy you in value or you can return the stock and get your money back. Get our 1922 Mating List and see what real value we are offering.

The MORRIS POULTRY FARM

J. S. MORRIS, Manager and Owner
LEBANON, OHIO

Cochin more profitable—from a utility standpoint,—let me say, that this can be accomplished, and only accomplished through proper selection and breeding, and without any need of tearing the Standard description to pieces.

"In my 26 years with Cochins, I have clearly demonstrated that bulk of feathering, or length of legs has absolutely nothing whatsoever to do with production or performance of a Cochin female, in fact, practically all of my best layers were birds of a low down blocky build, profusely feathered, and of such type that you, I know, would call Cochin.

"Repeatedly have I had pullets go to laying at 6 months old, and in a few instances, at 5½ and 5¾ months respectively. The two latter were remarkable and unusual performances of course, and may never happen again, but I bring out these points merely to illustrate what might be done with proper selection and breeding. I could write a heap more on this important subject but time will hardly permit. The foregoing lines,—while not an article,—are simply intended to convey my argument in favor of preserving the present Standard description for Cochins as it now stands, in justice to the breeders who through their many years of untiring efforts have actually made possible said Standard description.

"Should you at any time in the near future, have occasion to attend a meeting of the 1923 Standard Revision Committee, you will be at perfect liberty to present my views, and any claims which I have made, for the earnest consideration of that body, before they undertake to make any drastic changes whatsoever regarding Cochins."

Mr. Lyle Is Satisfied.

J. I. Lyle, Secretary of the White Orpington Club, after a visit to Fort Wayne, Indiana, contributes to the spice of life as follows:

"President Rigg stated, in substance, that the press reports of the Standard Committee's work were very misleading and incorrect and that the White Orpington Club's request had received great consideration and everything had been granted except the 'forward tilt of the body.' Of course, this statement is absolutely at variance with the poultry papers and even such very reliable writers as Frank Platt.

"Knowing President Rigg as we do, we accept his statement as to the facts. He has promised to send to us a copy of the official recommendations of the Standard Committee as soon as it is received from Chairman Branch.

"We pointed out to President Rigg that we had employed Mr. Edwin S. Megargee to make the drawings for the Club and that Mr. Megargee had spent a great deal of time in getting his sketches to meet the approval of many breeders and that we thought it would be much better to have Mr. Megargee finish these drawings for the Standard. We were assured by President Rigg that this would be done.

"After my interview, I felt that the Standard Committee had probably done very much better work than was indicated by the press reports and that the spirit and desire for co-operation was all that could be desired, but there can be no doubt that the Committee was extremely short-sighted and lax in not furnishing to the press a correct and authorized statement of their proceedings.

"It is a hard matter to correct false reports and these wrong impressions should never have gone broadcast as they have.

"Our visit was most pleasant, as any one would know who has ever met the genial President, or his delightful bride."

We thank Mr. Lyle for the compliment he pays us as a very reliable writer. But it was not necessary for him to depend on either reliable or unreliable writers. He had his own representative in attendance at the meeting of the Standard Committee, to present in person the changes that Mr. Lyle's club requested in the Orpington Standard, and to personally report to Mr. Lyle the action of the Committee.

It fell to President Rigg to shed the necessary light on the subject, who has often shown his ability to correct wrong impressions held by good men who are truly interested. He has evidently satisfied Mr. Lyle. Well, a lot of people, we fancy, will be satisfied when they get the Standard Committee's report, and we surmise that at Knoxville there will be more compliments than criticisms on the committee's work. It is better to get the kicks now than later.

Perhaps it is even better to have the Standard illustrations drawn to your order than to dictate the Standard text. Words

are elastic and convey different thoughts to different minds, but a picture tells a story fully and completely. We know of no better way to get ideals in the Standard than to furnish the pictures.

It will be an interesting experiment to have the Orpington ideals for the new Standard drawn under the supervision of Mr. Lyle and his co-breeders. Heretofore, all Standard illustrations have been drawn under the direction of the A. P. A., in accordance with the Standard text as furnished by the Revision Committee to its appointed artist. However, there is not an Orpington man on the committee this time, so Mr. Lyle has assured his friends, hence Mr. Lyle's paternalism. And why should we be tied down to old foggy precedents? Messrs. Lyle and Megargee will probably turn out a beautiful pair of Orpingtons that will illuminate the pages of the Standard.

Mr. Lyle has good birds, good ideas, and generous motives. He made one mistake and that was in assuming that he and the breeders of America were arranged on one side and an arbitrary Standard Committee held the fort on the other side. A really broad conception of the true situation as regards the Standard Committee's work is set forth in the following letter from C. S. Byers, Indiana, who also takes the opportunity to make plain some salient facts and opinions regarding the Orpington Standard. It is such communications as this from Mr. Byers that hold weight with men who are seeking information on which to form judgment:

Regarding Orpington Standard Revision.

"The technique of writing the Standard text of a breed is extremely difficult and the ability is not possessed perhaps by one breeder in five hundred. Superfluous wording should be eliminated and brief, specific terms used to convey the word picture of perfection.

"The use of unit measurements and fractions when describing sectional body proportions is invariably confusing and have no place in the Standard.

"In view of the above I will take the liberty of briefly reciting my views pertaining to certain criticism directed by some commentators, against the work of our Standard Revision Committee on Orpingtons.

"As a breeding characteristic I like an Orpington with a 'forward tilt' because the common breeding tendency is the reverse, but I am opposed to incorporating this phrase in the Standard. Likewise, as a breeding characteristic I prefer a bird with only four natural serrations in comb because the breeding tendency is toward more than five instead of less than five serrations in comb, but I would be opposed to making the Standard read 'four serrations.'

"I regard the Revision Committee's text for back shape as sufficiently clear and specific for it provides broadness at shoulders to be extended in saddle section.

"Much has been written during the past few months about fluff plumage in Orpingtons. Our Revision Committee has disclosed the following important information: 'Fluff is composed of the short feathers on abdomen below vent. Feathers on lower thighs and sides of body are not fluff.' So an Orpington that carries 'bloomers' at knees has excessive lower thigh plumage and I would suggest that this section be covered in the revision as follows: 'Lower thigh plumage moderately full but not profuse.' When this lower thigh feathering is not profuse or excessive it will not hide any portion of the shank when viewed on a level with the knee. I am, therefore, opposed to the suggestion of some breeders to insert a clause providing that this plumage hide from view any fractional part of the shank.'

"I am opposed to the Committee's action pronouncing any enamel white in earlobes of Orpingtons, a disqualification. My opposition is due to the striking excellence and superiority of many present day winning Orpingtons that carry this defect in slight degree but this action only adds another lap to the much discussed subject of whether Standard disqualifications should be retained or eliminated. It is reasonable to conclude that the rank and file of novices or beginners would favor their retention while the rank and file of expert, experienced breeders would quickly favor their elimination and listing of such imperfections as defects.

"In Standard making the war of contention, dissention and criticism should be won by respectful consideration of intelligent thought, good fellowship and an earn-

Four Incubators in One

Our "Four-In-One"

Price
\$138.00

Our FOUR IN ONE 800 egg section has FOUR independent egg chambers (of 200 egg capacity.) Each chamber is a complete incubator in itself.

With this one section you can set FOUR different kinds of eggs at one time or take off a hatch once a week, as you choose

Sectional Construction

Can be enlarged to a mammoth machine of 9600 egg capacity by adding more sections at any time required.

KILL THEM ALL

**Every Rat and Mouse easily destroyed by New Discovery
Not a Poison**

Absolute freedom from rats and mice is now assured everyone. No more trapping and poisoning just a few. Clean out the whole bunch, old, young, big and little.

Hick's Rat Killer kills every rat or mouse on your place. Most wonderful of all it does not harm anything but rats, mice, gophers, and other rodents. It is harmless to children, pets, poultry and all kinds of stock. It can be spread anywhere and will kill only rats and mice. This death bringing disease rapidly spreads and quickly destroys all the rats and mice. There is no smell or odor for they run outside for water and die away from the building.

A Trial Costs You Nothing

Mr. Hick is offering everyone troubled with these pests the chance to get rid of them at no cost to themselves. He will send three large double strength, one dollar bottles for the price of one. You keep one for yourself; the other two you sell to your neighbors at one dollar each, thus getting your own free and in addition making a dollar profit. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 886, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after 30 days trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

est willingness to proceed amiably to the final rulings of the governing body. Let us appreciate the ardent, strenuous and unquestionable conscientious efforts of the present Standard Revision Committee." C. S. Byers.

Another breeder, C. D. Snow, Rhode Island, who produces good birds, studies the classes each year at the Boston show, and has developed his own faculty for reasoning, writes:

"Am glad to see in the June issue that you explain to Mr. Lyle the error in the stand he takes as regards A. P. A. revision.

"He says the breeders are a unit in wanting the forward tilt. Of course he is in a better position to judge as to the demand for that than I am, but surely there is no call here for it. I am absolutely opposed to it, seeing no benefit to be gained. Lyle, Hobbs, and Delano are the ones making the most noise about this forward tilt stuff and I see no reason why the mass of smaller breeders should bow to the few who are in a position to make their influence felt.

"I want at this time to also tell you how pleased I was to read your editorial, 'Breeding or Feeding' in the May issue. This is the best thing I have ever read on the subject and expresses my sentiments exactly.

"Also the article on slab-sided layers is a thought in the right direction. Why should we try to make egg machines out of our dual-purpose birds?

"They are valuable and profitable enough without sacrificing all shape and form to mere numbers of eggs.

"I remember a bird I had several years ago that layed 140 eggs for the year's total, not very many, but she layed them in October, November, December and January, and they brought over \$9.00 in Uncle Sam's money. Surely this bird was profitable.

"It seems to me that if we forget this fad for eggs and more eggs and handle our breeds in a sensible manner, having in mind the true purpose for which the breed was created, we shall all be better off in the end."

Partridge Color, Again.

Perhaps the Partridge breeders are doing a lot of thinking, but not being satisfied that we have succeeded in driving home the salient points in connection with this color type, let us try again.

The changes proposed by the Revision Committee are radical. You who have been single mating, by using some females with striped hackles, will find that the Committee proposes to make the Partridge and Silver Penciled females, penciled in body color, including neck hackle. No more striped hackle to be passed without a cut.

In males you are to have the same color, the same black stripe, as the Brown Leghorn male. In producing these Leghorn males, the females used have striped necks, and chunks of black in their back plumage, with those lumps of black full of metallic sheen.

You are asked to produce the same black neck and saddle striping from a female that has a penciled hackle and a penciled back free from metallic sheen. You are nearer, rather than farther away from double mating. The Standard Committee sought to make penciling the first property of the female. Now, how should the male be? This writer's suggestions on the male were covered in last month's Journal. That suggestion is that you allow a red quill in that striped feather. If you call for the same solid stripe as the Brown Leghorn carries, you are not going to get it from

your pencil necked female free from metallic sheen in back penciling.

The practical way to make a single mating Standard, is to Standardize the fully penciled female; and then Standardize the type of male necessary to produce her.

The Prevention of Smothering.

If they had been earlier chicks, they would have been in the brooder until they no longer showed any inclination to block and crowd. But they were June birds, and, although the brooder lamp was kept going, yet they did not seek the shelter of the hover even though the temperature was kept as low as possible. So the brooder was judged unnecessary and was dismantled and removed from the brooder house.

All went well for several months; at night the chicks selected a favorite corner of the brooder house and distributed themselves uniformly over the pile of straw in their corner, showing no disposition to crowd and smother one another.

But there came a cold, rainy night in midsummer and with it a holocaust! For the next morning 12 chicks lay stiff and stark in a depression in the pile of straw in their favorite corner. Literally the poor things had dug their own little graves in their efforts to maintain their bodily heat by crowding together.

Evidently then, loosely piled straw would not answer the purpose of preventing the crowding of the chicks to a dangerous extent on cool nights, although poultry books frequently direct the use of straw, piled in the corner, for this purpose and making the statement without qualification as though this method is absolutely infallible.

What was to be done? Advice was had that straw tightly packed would answer. But it is difficult to pack straw tightly because of its springy, loose nature, and besides, the chicks could readily burrow into it, even if fairly tightly packed, and prepare for themselves a veritable "Block Hole of Calcutta." Certainly after the above recorded, sad experience with straw no disposition was felt to further risk the lives of the remaining chicks by the use of straw in any form.

Advice from another quarter professed success with cut corn fodder but this seemed to offer no advantages over the straw because of its loose, light nature.

In looking about for other materials to apply to this purpose, a pile of clods, which were being used for litter, came in for consideration. These clods consisted of clumps of short bunch grass with the roots and earth still attached, which had accumulated from some landscape gardening work. In general, these clods were about 3 inches in diameter and from 6 to 10 inches long. They appeared to be just the thing; they were moderately heavy and could be packed tightly so that it would be impossible for the chicks to burrow into them. And furthermore, they were sufficiently springy, when packed, to provide a satisfactorily soft resting place for the chicks. These clods were piled up in the favorite flocking corner to produce a gradually sloping down to the floor and were then moderately well packed down. This degree of sloping was just sufficient to give to the backs of resting chicks enough slope to cause other chicks to slide off if they made any attempt to pile up on one another.

The flocking place so formed was turned over and re-made every few days, and thus kept clean and springy. After a week or so the pile of clods were either discarded or used as litter. No sweating or mustiness of the clods developed as they were allowed to become bone-dry before being used.

Since adopting the use of clods as material for the flocking place no further trouble has been experienced.

Penna.

The type of house used on the farm of Farley Porter, Sodus, N. Y. This plant is located on a hundred acre fruit farm.

Announcement

Albert Angell, Jr., lifelong poultry expert, author and lecturer of national reputation, and well known throughout the poultry world for his ability in formulating feeds for growing chicks and securing eggs, has been secured by Rosenbaum Brothers, Chicago, to establish and manage their Poultry Department.

Rosenbaum Brothers need no introduction to the grain business, having been established on the Chicago Board of Trade for over 50 years and known far and wide as "The House of Integrity."

Four years ago Rosenbaum Brothers decided to enter the field of commercial feeds and have since erected one of the most modern concrete and steel milling plants in the United States. It was the original intention to make progress slowly and build up an organization second to none and finally offer to the poultry world *the most scientific and profitable feeds that can be made.*

The logical selection of a poultryman to formulate these feeds and assist the poultry raisers in getting out of their flocks all that may be in them in profitable returns, was Albert Angell, Jr., because of the high reputation he bears wherever poultry is raised.

So convinced are we that Mr. Angell deserves the reputation he enjoys that

we do not hesitate in admitting that he is also the highest priced poultry expert in the country.

Having thus secured the best talent to be had regardless of cost, we, Rosenbaum Brothers, stake our reputation of 53 years in the grain business with Albert Angell, Jr., and assure the entire poultry and feed fraternity that in actual results obtained his feed formulae cannot be duplicated.

Mr. Angell is now at work on the masterpiece of his life in poultry literature—is writing page after page of the very material he is made of—*originality in poultry feeding and management*. We know nothing of the nature of the surprise he is to make known for the first time through the pages of his new book, but rest assured that what this expert puts his name to will be backed up by

Rosenbaum Brothers

THE HOUSE OF INTEGRITY
Chicago, U. S. A.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I want to express my appreciation and endorsement of the article by Harry G. Forster, entitled, "Some Poultry, Fruit and a Vegetable Garden." It is the gospel I have been preaching for many years. I hope every reader of the American Poultry Journal will read and carefully consider that article.

* * *

For family reasons I desire to get a poultry location somewhere on Chesapeake Bay within easy reach of Baltimore. Is much of the land along the bay heavy black, or clay soil? To what extent do bad fogs prevail in winter? What is the difference in market for eggs and poultry between Baltimore and New York? Is the east or west shore the best from both a soil and market location? Do you consider the bay country a good location for poultry and small fruit?

Oregon. F. W. Mattson.

I referred the above letter to our mutual friend, Geo. O. Brown, of Baltimore, Md. Mr. Brown replied as follows:

"You can secure fine farm land, excellent for growing any kind of farm crops, including all small fruits. Such farms are located but a few miles from this city, on good concrete roads, and also having good transportation facilities in many sections, by both steamers and railroads. There are quite a number who are making a combination of small fruits and poultry and eggs. These are mainly located on what is called the Eastern Shore, where the soil is light and in some sections sandy. They raise strawberries, red and black raspberries, blackberries, currants and gooseberries, plums and peaches. Quite recently a number of apple orchards have come to bearing stage, and surprised every one by yield and quality.

"The same conditions exist in southern counties of the state, where there are tributary rivers that lead to the Chesapeake Bay. On the eastern shore there is direct railroad connection with Philadelphia, but only boat transportation to Baltimore, consequently the bulk of most of these crops from there are shipped to Northern markets, where they generally bring better prices. The southern section I refer to is located near Annapolis, our Capitol, on fine roads, and there is opportunity to ship products to Baltimore and Washington markets. Maryland is said to have the best roads of any state, and trucks may be used. Occasionally there is very little difference in the price of strictly fresh eggs, which are termed 'nearby shipments,' between New York and Baltimore. The climate is such that outdoor work can be done with comparative comfort nine months of the year. Fogs are not much of an annoyance, hardly ever expected to occur except when unusual weather conditions seem to cause fogs throughout the eastern states.

"I do not hesitate to declare that a real live wire man that knows something about growing the products you mention, could locate here and make a pronounced success. I have frequently visited all the sections I have referred to, while talking on poultry at our farmers institutes. A writer said in answer to similar questions, after answering them, that the enquirer 'might travel the whole country over from ocean to ocean and he would fail to find a better, brighter, purer land to live in than "Maryland, My Maryland."' And I heartily endorse his opinion and judgment."

Geo. O. Brown.

* * *

In the course of a conversation that took place a few days ago a gentlemen said to me: "Ask Thomas F. Rigg and accept his answer as final."

The questions follow:

Is Johnson county, Ill., adapted to fruit raising? The land is hilly and stony. It is not a successful corn raising country.

Could a good marketable variety of winter apples be successfully grown there?

What size trees should be planted and when should they be set out? How many trees to an acre?

Illinois.

Geo. B. Crockett, Jr.

Johnson county, Illinois, is especially well adapted for the raising of apples commercially. The sub-soil over a large portion of Johnson county is clay bounded with loose rock of various sizes. This is an ideal condition for the roots of apple trees. The land is hilly and the air good.

If I was planting a commercial apple orchard in that county I would select: Delicious, Grimes' Golden (doubled worked on Delicious stalk), King David, Senator and Black Ben. With the exception of Black Ben the varieties are apples of the best quality also bringing highest price on market. The Black Ben is a wonderful producer. It is an exceedingly large, red apple which will keep in storage until well into June. It is practically an annual bearer and while not bringing as high a price as other apples named it yields so heavily that it is an exceedingly popular variety.

If you could secure properly grown one-year apple trees, that is the kind I would plant. However, a one-year tree if not properly grown would not be a wholly safe proposition as to plant a two-year old.

* * *

In which part of New Jersey are mosquitos the thickest? Are there many mosquitos around Camden, N. J.? If so, how many months of the year are they active? Are there any fogs at Camden? Also give me some idea of the climate conditions there.

Arizona.

W. H. Douglas.

The Jersey "sheeter" is not nearly as bad as he is represented to be. Neither are there as many of him as is claimed. In no part of New Jersey are the mosquitos a serious pest. A few years ago I was in Camden for two weeks in July and was not bothered by mosquitos. Fogs are not frequent on the Delaware river at Camden. The climate conditions of New Jersey are favorable to pleasant living and to the production of fruits and poultry. The geographical location of the state is exceedingly favorable.

* * *

I would like to plant about five acres with fruit trees and I would be much obliged if you would answer the following questions: 1. What kind of soil is best for apple growing? 2. How would you prepare the soil? 3. Would it be all right to dig a deep hole, put some manure or fertilizer on the bottom, cover it up with some dirt, then set in the tree? 4. Is poultry manure any good for fruit trees? 5. What variety would you advise to plant here? 6. How far apart should the trees be planted? 7. How old trees would you advise to plant? 8. How many years would it take before they would bear? 9. Would you advise to plant plums, raspberries or blackberries between for a few years? I intend to buy this land and work in the city and in a few years start a chicken farm.

Michigan

Wm. Koinaway.

1. A sandy loam with clay sub-soil is best adapted to the apple tree. 2. The soil should be thoroughly plowed and harrowed. If the sub-soil is especially heavy use a sub-soil plow. This work should be done in the fall before trees are planted in the spring. 3. The land should be prepared as above stated before trees are set. You should dig hole large enough

New Super-Virus Kills Every Rat

Improved Virus, Not a Poison, Quickly Wipes Out All Rats, Mice Gophers.

A last, a perfected rat virus that can be depended upon to destroy rats, mice, gophers and other rodents. Anywhere, at any time.

The virtue of any rat virus is in the Danys organisms—disease breeding organisms that will only rats and other rodents.

Repeated tests of virus made with salt solutions, agar and bouillon, as media for carrying the Danys organisms, show that decomposition occurs which destroys the organisms in a few days.

Hunter Super-Virus is made with a different and superior carrying medium. Decomposition does not occur. The Danys organisms, in billions, are kept alive and virulent, even for months, until used. Stands shipping in any weather.

Bait prepared with this Super-Virus is a tempting dessert to the wariest of rates. In a few days they are dead. Meantime the diseased rats foul their runways, spreading the virus organisms and exposing other rats to the disease. The same with mice and gophers. Yet it is harmless to people and all animals except rodents.

Lowest In Price

Hunter Super-Virus is sold on a positive guarantee. Send only \$1.00 for a 30 c. c. \$2.50 bottle postpaid. Over 20 to 50 times more rat killing effectiveness than an equal quantity of any other form of virus. Or if you prefer, send no money, but pay the postman the \$1.00 and few cents postage when he delivers the package. If not satisfied with results in three weeks, ask for and get back the \$1.00 promptly. Send today to the Hunter Laboratories, Dept. 119, New Nelson Bldg., Kansas City, Mo.

to allow the roots of the tree to spread out. Do not under any circumstance put manure or commercial fertilizer in the hole wherein you plant the tree. All manure and fertilizer should be scattered on the surface of the ground and harrowed in where the feeder roots can obtain it. The feeder roots are comparatively close to the surface of the ground. 4. Poultry manure is rich in nitrogen and is a good fertilizer. It makes wood growth. 5. Plant Delicious, Golden Delicious and Senator for commercial orchard. 6. 30x30 feet. 7. Two-year-old trees. 8. The varieties above named will bear a crop about the sixth year from planting. 9. Do not plant plum trees as fillers in an apple orchard. The apple tree and plum tree require different cultural care and spraying. If you will give the orchard proper care you can plant blackberries and raspberries between tree rows, but I advise you not to do so. Would rather plant corn or potatoes.

* * *

My wife has the asthma and cannot live here. Where can I locate to her advantage and do well as a poultry and fruit raiser?
New York. P. Van Douglan.

I think you would find the "Land of the Sky" in western North Carolina a favorable place. Asthma cannot exist there. It is a wonderful fruit country and all conditions are favorable to poultry production.

* * *

I would like some information regarding the district tributary to Jacksonville, Fla., as a location for the poultry business. Would this be a good location? Do chickens do well there? Does it get very warm in summer time? Would you advise anyone to go there to locate in the poultry business? Do they get much wind there and is the climate tolerable even?
Washington. F. E. Bailly.

The poultry production in Florida is annually increasing. Jacksonville is located on the extreme northeastern part of the state. There are many successful poultry plants in that part of the state. There are some very hot days. Write W. E. Brown, Le Land, and S. D. Hardaway, Orlando, for detailed information concerning poultry production in Florida.

* * *

I am much interested in fruit. Have you ever written any book on the subject? I would like to buy such a book. Can you give me the title of a good one and where I can get it? I especially would like to get the best information obtainable on raspberries.

Indiana. Elby Campbell.
"Small Fruits" is the best book on the culture and care of raspberries. There are a number of other books which you should have. Write the American Fruit Grower, State-Lake Building, Chicago, Ill. They can supply your wants.

* * *

I have always been interested in poultry business and have had from 20 to 30 hens and they have been doing fairly well. I wanted to get started into the poultry business but haven't quite enough capital. I have bought 5 acres of land (no buildings) and that has taken all that I had. The land is a sandy loam and has quite a few stones in it. What fruit trees would do the best in this soil. I wanted to try and raise enough vegetables this summer to give me a little start next spring. Do you think I could get started in this way? What would be the most profitable way to manage this five acres this summer. It is on a main highway four miles from Pontiac. I work in Pontiac but haven't been working to amount to anything for the past year. I wanted to set out a few hundred strawberry plants, do you think they would do very good?
Michigan. Jake Schmitker.

STILES' POULTRY Leg Bands

AT REDUCED PRICES

We offer the better grade of bands, which do give good service. Six sample bands, all different, 10c.

WHITE ORPINGTONS

WILLIAM N. OTTO
5425 College Ave. INDIANAPOLIS, IND.

Your soil seems to be especially adapted to the profitable production of small fruits and berries. Strawberries and raspberries, blackberries currants and gooseberries are quick money yielders. The profit from these ought to put you on your feet, financially, and allow you to go on with your poultry operations and the building of a poultry plant. You will find the fruit and poultry combination a good one. For the first year you can raise vegetables between the rows of small fruit. Your location is a favorable one and I see now reason why you should not succeed.

Crowding of Chicks.

A big cause of loss or at least slow growth, is the piling up of the chicks in the brood coops after the hens have left them. These chicks should be transferred to larger roosting quarters or if this is impossible, roosts should be placed in the brooder coops.

Where many chicks are raised, it is particularly important to get them on to fresh ground for summer rearing. This is usually done at about the broiler age. At this time the cockerels are separated from the pullets and the pullets removed out on to clean soil. Many farmers seem to think this an unnecessary precaution but with the rapid spread of poultry diseases in the state, this question of soil sanitation is becoming really an important one.

Separation of chicks by size and separation of chicks from the older hens are important steps to be taken if the smaller chicks are to have a fair chance and make a good profit. Until farms are so equipped that these things can be done, the poultry business is going to be more or less an uncertainty and the labor cost is going to be high. Chicks need shelter, shade, pasture, and feed and water before them at all times. These things are insurance policies to ward off disaster.

GAPES:

Gapes in chicks is usually due to chicks running on contaminated soil and the usual recommendation for a permanent cure is to get the chicks on new soil and keep them off the old contaminated quarters for a period of two or three years. The West Virginia Station makes the following additional recommendations:

1. Burn or bury deeply all chicks which die of gapes.
2. If possible, keep the chicks shut in until the dew has dried off fully in the morning.
3. If the disease is very prevalent add not more than three drops of creolin to each pint of drinking water and prevent the chicks from drinking elsewhere.
4. If a few chicks become infected, remove the worms with a gape-worm extractor, and burn them so to prevent their eggs from becoming scattered about.

CANNIBALISM:

A number of complaints are being received that chicks are either toe pecking or else actually eating up each other. These complaints usually come where chicks have been kept in confinement or else in small bare yards for too long a period of time. Chicks are much like children—they have to be kept busy to be kept out of mischief. Turning the chicks out on free range and closing your brooder house doors so that they cannot get back in, will often solve the problem. Where conditions are such that they must be kept in limited quarters, the use of deep litter on the brooder house floor is recommended. This means three or four inches of litter, not just an inch. Good clover or alfalfa hay run through a cutter box and cut into short lengths makes very satisfactory litter for this purpose. Use three or four inches of it and where chicks are toe-pecking scatter a light feed of grain in this litter at least five times a day. This gives the chicks something to work for.

BREAK UP BROODY HENS:

The egg record cooperator who is playing fair is counting all hens regardless of whether or not they are setting. It is very evident that the person who takes pains to break up the broody hens quickly is going to get those hens back into laying again and hence have a better record and make more money than the person who is careless and allows the hens to set a week or so before being broken up. Usually our highest laying hens are those which go broody the fewest times during the spring season. The hen which goes broody six or eight times during the

spring or summer has mighty hard work to get much over 120 or 130 eggs a year.

INFERTILE EGGS:

Thousands of dozens of eggs are spoiled when they reach the final market simply because the male bird is allowed to remain in the flock during the summer season. Your local buyer may not pay you any higher price for infertile eggs than for fertile ones yet in the long run every dozen eggs spoiled on the way to market or before, causes your buyers to pay you a lower price for eggs. If you ship eggs to eastern markets or sell them to private trade, it is absolutely essential that you produce infertile eggs during the hot months.

LICE ON HENS:

Sodium fluoride as a dip is an easy way of getting rid of the body lice. The weather is now warm enough so that this can be safely done and in spite of the rush of the spring work it should not be neglected.

Sodium fluoride can be mixed at the rate of two ounces to a gallon of water. It requires about five gallons of solution to treat 100 hens. It kills the lice and mites. These cautions are necessary: Use luke warm water; select a warm bright morning; treat all hens on the farm.

Stand hens in a tub of the solution and ruffle feathers with fingers to let the solution penetrate. Hold the beak closed between the middle finger and forefinger of the left hand curving the forefinger around the nostrils and dip the hen's head under for about five seconds. Care must be taken not to let the fowl get the solution in the mouth and nostrils. It may cause irritation. Don't forget the roosters—they may soon reinfest the flock.

U. S. Farmers' Bulletin No. 801 takes this up in detail. Copy may be secured free by writing to the Division of Publications, U. S. Department of Agriculture, Washington, D. C. for it.

Brooding Chicks.

So many people lose a large percentage of chicks when trying to rear a small number without the help of a hen, that I feel my method of caring for a brood of fifteen or twenty might be of interest to others. It is understood without further statement that they are properly fed and that quarers and feeding utensils are kept clean. I wish to tell, then, of their house, the place where they rest and keep warm; of the care they need and must have if they are to grow into strong, healthy pullets and cockerels.

When the chicks arrive secure a box about two feet square and build on it a roof that can be lifted off. Just below the roof make five or six small holes for ventilation and in one lower corner make an opening, large enough for entrance and exit, which can be covered with a screen at nights thus allowing ventilation from below. Cover the floor of the box, first with a newspaper and then to a depth of one or more inches with chopped alfalfa or a similar litter. In the center of the box set a gallon jug of the type that has a flat shoulder and fit over this, so that it will extend nearly to the sides of the box, a canopy of cardboard. The cardboard can be shaped and fitted easily by use of a pair of shears and can be strengthened and stiffened by hoops devised from baling or other light wire. Put around the jug, to keep the chicks from actual contact, a sack made of flannel and hang from the underside of the canopy three or more skirts of flannel in such a way that they come within two inches of the floor. Make a few small holes in the canopy near the neck of the jug so that inside ventilation will be good. When every thing is in place fill the jug with hot water and the brooder is ready for its family.

While the chicks are tiny the hot water should be changed three or four times in twenty-four hours; as they grow older fill twice, then once and finally not at all. When the weather is cool use very hot water. If it is too hot the biddies will stay near the edge of the canopy or in the corners of the box.

I have used this sort of a brooder for a small number of chicks at different times and have usually lost none. Of course it takes care, but care is a pleasure to one who likes poultry, and will be repaid by a flock with vitality; a flock which will fill winter egg baskets and from which one can choose birds that will win the blue.

Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying.
Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 216, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

Poultry Without Lice

The U. S. Dept. of Agriculture Bulletin 801 says there is no fundamental reason why a flock should not be entirely freed from lice and maintained so. After a number of their tests with different materials, nothing else was found to be so effective and satisfactory as

SODIUM FLUORIDE

Clemson Agri. College, So. Carolina, says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried." Twenty-one other State Agri. Exp. Stations say the same. Also effective against cockroaches—water bugs, ants and plant lice.

IVO-SAN SODIUM FLUORIDE is air-floated, fine as flour, of highest grade, but costs no more. Two pound can, with copy U. S. Bulletin 801, \$1.00, postpaid. Send for free sample, if you want to test it first. Send today—solve your lice problem.

The Leghorn Condemned As a Farmer's Fowl.

(Continued from page 737)

this particular test was 263.6. Figuring all feed at a cost of \$4.50 per hundred (it is lower now but that is a fair average, the year round, on basis of past two years) this means a cost of \$5.08 for the 263.6 eggs. To have produced 263.6 eggs from the heavier varieties, on basis of their actual production in same test, and with same food basic cost, would have required feed to the amount of \$7.99.

It is this factor which makes it more profitable to use Leghorns for egg producers, even though the worn-out hens were to be absolutely thrown away after finishing their period of profitable production.

At the egg laying contests in New Jersey, it was found that the average weight of eggs from all breeds was 2.01 ounces each. Rhode Island Reds eggs averaged 25.08 ounces per dozen; Plymouth Rock eggs averaged 24.48 ounces per dozen; Leghorn eggs averaged 24.24 ounces per dozen; Wyandotte eggs averaged 23.88 ounces per dozen. This two-year test shows but 4-5 ounces per dozen greater size for the Reds than from the Leghorns; $\frac{1}{4}$ ounce larger from the Rocks than from Leghorns, per dozen; and the Wyandottes—one of the larger breeds—actually laid a smaller egg than the despised Leghorns.

Quoting from the official report of that contest:

"We find that because of heavy production, low feed cost and increased selling price for white eggs, the Leghorns far outstripped the American breeds. We find also that the Plymouth Rocks, Wyandottes and Rhode Island Reds are in a class by themselves in respect to this profit factor. The first year the Leghorns paid a net return above feed of \$4.34, while the American breeds paid a net return of \$2.90. The second year the Leghorns paid a net return above feed of \$3.41, while the American breeds averaged a little less than \$1.50. In computing these results no consideration is given the greater weight and value of the carcass from the heavy breeds, which is about offset by the increased cost of producing the pullets."

Does not this speak for itself?

If you do not have a copy of Bulletin 338, "The First Two Years of the Vineland Contest," I would advise that you write Prof. Willard C. Thompson, New Brunswick, N. J., who will gladly send you a copy, and it will give you a great deal of authentic data on this subject.

Mr. Unkenholz, in spite of the poor market quality of Leghorns as usually found in the market, and in spite of some flocks not producing eggs of desired weights, the Leghorn is a fixture in this country, and its profit producing characteristics will cause it to continue to be the most widely bred fowl in America, and even if you and the buying interests quit handling Leghorns as table poultry altogether, it will not alter this fact.

But, if you will study the matter with an open mind, and then devote your energies to evolving a system which will force the Leghorn producers to put their Leghorn carcasses on the market in best possible condition, and to increase the size of their eggs as they can easily do, you will accomplish a vast benefit to both the producing and consuming interests, and will not reduce your own business profits in any way.

This Club, but recently organized (originally organized in 1903 as a "fancier" body, gradually declined and became inactive about 1913—but reorganization started in September, 1920, and now functioning for the advancement of the Leghorn from an economically sound basis) now has a strong committee working on this problem. Our committee has been instructed to approach the problem from the attitude of their being something wrong with the methods used by the producers in preparing and marketing their output, rather than from the attitude that someone is trying to do on injustice to the breed, and as soon as we can make proper arrangements, we expect to inaugurate an intensive campaign of education looking to the improvement of both flesh and eggs from our Leghorns.

We would welcome your co-operation in this work, and we trust you will see this matter in this, its true light, and aid us in our constructive efforts rather than continue with mere destructive criticism.

D. Lincoln Orr, Secretary New York show, has been given full management of the New Orleans, La., show.

The 100% Satisfactory NEWTOWN

The present season has again demonstrated Newtown Incubator Supremacy. Thus history repeats itself. For many years the Newtown has stood first, as judged by results. Poultrymen everywhere know the Newtown as the incubator that **"hatches the most chicks, the best chicks, with least labor and at lowest cost."**

Newtown Supremacy is due to perfection of design and honesty of construction. The machine incorporates the essential principles of successful incubation—it has been refined and perfected through years of study and investigation, backed by wide experience—it is built of the finest materials by expert mechanics—it is fitted with the best of labor-saving, results-giving devices—it gives 100% satisfactory service for many years.

New types of incubators come and go. Inexperienced buyers make expensive experiments, then turn to the time-tried Newtown for real results. Year by year Newtown Sales increase solely because of Newtown Merit.

If you are buying your first giant incubator, order a Newtown and get the best machine first. If you must replace present unsatisfactory equipment, order Newtowns and be sure of satisfaction. If you are increasing your incubator capacity, order Newtowns and learn what real hatching results are.

It isn't too early to decide and act. Our special inducements for early orders will interest you. It will pay you to investigate NOW. Write us at once—tell us what egg-capacity you will need. We will write you promptly and fully, and tell you something that will be greatly to your advantage. Of course you'll want a Newtown next season. Let's go!

A Historical Account of the Black Giants.

(Continued from page 734)

was written by Mr. Platt. This was the beginning of the egg producing wave of interest and as Mr. Platt's introduction was not followed up the second opportunity for the expansion of this breed was lost.

These birds as now developed by the more careful farmers are very large. Old roosters will frequently weigh over twelve pounds and sometimes up to fourteen pounds. Old hens get very fat and weigh ten to eleven pounds. Early hatched cockerels go up to ten or twelve pounds and pullets around eight or nine pounds. There are all sorts of stories concerning capon weights. So far the writer has never seen a fifteen pound capon, although such birds have been reported. Mr. U. L. Meloney of Matawan, N. J., Proprietor of Marcy Farms, has been the greatest recent promoter and should be given much credit for popularizing the breed. Back in 1912 when the State Agricultural College ran a special train, giving agricultural lectures through the central part of the state, this breed was recognized for its merit in meat production. In 1917 the writer met Mr. Meloney in his place of business in New York City and found him enthusiastic over Black Giants because of their wonderful market quality. Mr. Meloney said as he had some very particular trade which only

Four year old Black Giant Capon owned by Dexter P. Upham, New Jersey.

Black Giant capons would satisfy. Mr. Meloney was encouraged to promote this breed which he had already decided to take up and was given the addresses of some of the best farm breeders. In January 1918 the writer was instrumental in having a cockerel and a pullet exhibited at the State Poultry Show in Trenton. These were the first birds of this breed so far as has been learned ever placed in an official American Poultry Association show.

In the next two or three years Mr. Meloney made some splendid showings at Madison Square Garden and other smaller shows. In the summer of 1921 a Jersey Black Giant Breeders' Club was organized. Since that time Mr. M. L. Chapman, the manager of Wilburtha Poultry Farms near Trenton, has taken an active interest in the breed. Mr. Chapman started several years ago believing that the true meat producing qualities of this breed insured a tremendous popularity for it just as soon as it was given an opportunity to expand. Mr. Chapman was elected secretary of the Club and has not spared himself in the least to place this great breed in the forefront of American poultry. This Club drew up a tentative standard for the breed which has this year been considerably modified and has made application to the American Poultry Association for the admission of the breed into the Standard of Perfection.

Breed Characteristics.

All the preliminary requirements were thoroughly carried out and it was hoped that the Revision Committee would immediately report favorably. On the contrary, however, the committee reported unfavorably and it now remains for the Giant breeds to convince the committee of the error of their ways. It has been stated that the committee's chief reason was the similarity between the Black Java standard and the proposed Black Giant standard. The tenta-

tive standard submitted by the Giant breeder, is to blame for this as it does not express some of the true Black Giant characteristics, which the Giant breeders will explain to the A. P. A. convention. The Giant back is not horizontal. It carries too much meat. In the best specimens the back rises in a curve at about an angle of twenty degrees from the horizontal on the male and perhaps fifteen degrees on the female. The male and female both are all curves with no angles and are very deep bodied. Their eyes are solid dark, hazel or nearly black, and their combs run rather heavy. They are more loosely feathered than the Javas. On range they are in a very distinct class by themselves. It is thought by some that some old time imported blood gave this breed their remarkable ranging nature. In the summer time after July 10 when the grain has been harvested the farm fields will be dotted all over with these fowls. Just as soon as they can see their way in the morning they will be in the fields and remain all day clear up to dusk. They clean the fields of grasshoppers, crickets, spiders, etc., to say nothing of every kernel of fallen grain. Their ranging compares very favorably with that of turkeys excepting that they do not keep together. They go out singly to a distance of half to three quarters of a mile from the farm buildings and only come to the buildings for water if there is none nearer.

This is their first and outstanding characteristic. The second point which alone entitles

Old wind mill, poultry house and barn on Black homestead, where Black Giants were originated.

them and will eventually win them a place among the most popular breeds of poultry is their market quality. They are America's premier meat breed. After they have their frame growth they fill out and their flesh holds soft and tender. New York hotel supply buyers say that the fat and lean are mixed as in high class bacon hogs. Seven months old pullets and ten months old capons on the average make the highest quality dressed carcasses, while the old hens and cocks make splendid fat fowls both for roasting and stewing.

This article would not be complete in the mind of the writer unless certain cautions were suggested. It is urged that enthusiastic promoters of this breed do not allow themselves to claim unwarranted qualities for this breed. For instance, they do not lay any larger eggs than other breeds—just as large on the average, no larger and no smaller. The hens are persistent sitters. The chickens do not mature quite so fast as other American breeds but a little earlier than the Asiatics. It has not been proved that they will do as well closely confined as when given range. As old fowls they need special attention for laying and breeding purposes as they are very apt to get too fat.

In conclusion here is a breed fully developed and with over twenty years of pure breeding behind it. It has outstanding qualities as a meat breed which have made it the highest priced market fowl in the world. It is the largest pure breed. It is extremely vigorous and it is now in a receptive mood for the greatest wave of popularity which has perhaps ever been known among breeds of domestic fowl.

The growing demand for market poultry will be met by the farmers of the United States. This increased demand is one of the results of the war and is probably capable of far greater expansion if properly cultivated. The supplying of high quality products is the one satisfactory method of promoting and holding the public's patronage. Here is an almost perfect breed for supplying the poultry epicurean. The demand is here and the breed is here.

Stop Hatching Weak Chicks

With Cheap Incubators

Remember, it is not how many you hatch out that counts, but how many you raise. Chicks that hatch out **weak and wobbly**, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Chicks That Live and Grow

The Queen is accurately regulated—taking care of a temperature variation of 70 degrees without danger. It is built of genuine California Redwood—very scarce in these days of imitation and cheap substitution. Redwood **does not absorb the odor** from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, **retain the odors**, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is **cheap in the long run**. It will be turning out high percentage hatches years after the cheap machines have been junked. Sold by dealers. Catalog sent free on request.

THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

Summer Care of Growing Stock.

(Continued from page 733)

are black splashed with golden. It makes little difference about the markings of these feathers as they drop out a little later and the larger chick feathers appear. The wing feathers in this stage are long and pointed and splashed with golden, the breast, neck and back are usually very dark. When these have made their full growth another molt takes place followed by the adult plumage.

It is only when the adult feathers begin to come in that we can tell anything about the color and lacing of the chick. Wing feathers appear first and are usually good. Then the wing bars in the males and the very pretty laced feathers of the females begin to unfold. If the wing bars of the males are heavily laced or spangled they are removed from the flock and sent to market. Breast, neck and saddle feathers make their appearance next. If they show too much black they follow their brothers with poor wing bars. Of course those that have pronounced defects are disposed of as broilers.

By this time our flock is cut in half, if the culling has been rigorous and only the best retained. Life is too short to bother with inferior specimens. Remember only one cockerel or one pullet in any one variety can win the blue at the Garden or any other show. "Many are called but few are chosen." Let the beginner remember that and cease to expect every bird hatched out of a ten dollar setting of eggs to be a winner.

Goose Raising for Profit.

Now that many farmers report that they cannot raise turkeys successfully it seems to me that some of them could turn to the more plebian goose, and with less trouble get the same returns as from our national bird. It is necessary to have plenty of cheap pasture, preferably with a stream or pond in it or one so rocky that cattle would not thrive if served admirably, and if geese are given plenty of water to drink twice a day they will get on without the swimming except during the mating time, when a tub can be provided.

Geese need no food except pasture during the summer, and in the late fall this can be supplemented by cabbage leaves, wind fall apples, ensilage, cut clover, hay, alfalfa, mangel-wurzel beets or any waste vegetables. When you wish to feed for eggs, which around here in Connecticut is about February 1st, a mash of equal parts of corn meal, middlings, bran and 10 per cent of beef scraps is fed in the morning and wheat or corn at night. Grit and oyster shell is necessary when they are laying, and an advantage at all times.

During the laying season plenty of drinking water should be provided, and also a tub to swim in unless they have access to a stream or pond.

Water to swim in is especially necessary for geese mated with wild or Canadian ganders, and these should not be fed for eggs as early as the more domesticated breeds, as the wild gander does not fertilize the eggs so early and I have heard of cases where only the late eggs hatched, on that account.

The variety one should raise depends upon your location and the market that you cater to. Some people raise geese only for the feathers in which case a white breed is to be preferred, others like a large fat goose such as the Toulouse. Probably the larger number of people, who are not raising fancy stock for breeding or show purposes, will select a wild gander mated to a Toulouse or Embden goose as their goslings are very hardy, good foragers and mature quickly into the choicest goslings, which are not as fat as the others and of superior flavor, but these geese are generally sterile and seldom breed.

The Toulouse goose lays from 20 to 35 eggs when two years old and mated with a wild gander the eggs are more apt to be fertile than with one of the same breed. Very few wild ganders will mate with more than one goose at a time, although occasionally they will. The wild gander is very long lived, I have heard of one living for a hundred years and being used for breeding purposes, and I know of one now thirty-five years old, who was the father of a large flock this season. Ganders of the standard breeds are generally kept until ten years old, while females will lay well for about fifteen, and are probably the best from 3 to 6 years old, depending somewhat on the breed.

Mature geese do not need a pen except in severe winter weather, but a shed or some place where they can get away from the worst storms is best. This place should be kept reasonably clean, and have plenty of clean straw on the floor, much of which the geese will eat if no better roughage is provided.

An old barrel makes an ideal nest, and it should be in some secluded spot where the chickens and children will not bother the

goose. This is as much for the child's protection as the goose, for older ganders are sometimes very cross during the mating season, especially the wild gander, although he will later in the summer go off by himself and not keep with the flock as the ganders of other breeds do.

The eggs should be removed from the nest as soon as layed, and a few china eggs put in. Store the eggs in a cool damp place, and when you have nine or ten place under two hens. Some people hatch only with hens, but if the goose is a good mother, not being too cross, the last eggs may be given to her. They will hatch in 28 or 30 days, then remove from the nest, and keep warm until all are out when they can be given to one hen. Keep the hen confined and let the goslings run on new grass. Give them plenty water to drink, but do not let them get wet. Feed nothing for the first two days, then small quantities of bread dampened with milk or if that is not convenient any of the mashers recommended for growing chickens may be substituted with 5 per cent of grit or sharp sand added. After ten days or two weeks the hen can be removed and the goslings will take care of themselves, if given plenty of green food, and protected from their enemies, the worst of which seems to be rats. A low wire fence that may be moved often is the best way to give them a good start, and keep them out of mischief.

A small amount of salt occasionally in the mash seems to be good for them, and when six weeks old add 5 per cent of beef scrap. The way to handle geese is by the neck, holding firmly with the body next to you.

A friend of mine had a trio of two year old African geese this year, from which he has four young while I with a two year old Toulouse mated with an old wild gander have nineteen—she layed 22 eggs and hatched 20. These goslings weigh from 11 to 15 lbs., and as geese sell here for from 50 to 60 cents per lb. you can figure that I will get a tidy sum from this pair, and next year the goose ought to lay more eggs. It was impossible to keep an accurate account of the feed they consumed, but it could not have been more than \$1.50 per bird.

When you wish to fatten your geese confine them, and keep corn and water before them for ten days or two weeks.

The breeds admitted to the American Standard of Perfection are the Toulouse, Embden, Chinese, African, Wild or Canadian and Egyptian. The last is a purely ornamental fowl, and the others are popular about in the order given. Many people keep geese entirely for showing and selling the stock for breeding, in which case I should pick the variety that appealed the most to you and was in greatest demand in your locality.

The Toulouse are the largest of the Standard breeds, they lay well, but the eggs are not always as fertile as the smaller breeds, whose other advantage is that they look well on a lawn and will not injure the grass by pulling up roots and all.

The Embden is a large white goose, and on that account is often preferred to the grey Toulouse, although they do not lay so many eggs.

The Chinese lay well, but are small and not so friendly. They come in brown and white.

The African resembles the Toulouse somewhat in coloring, but has a longer neck and more erect carriage. They do not lay so well and require more pasture as when confined they will eat the grass and roots.

The wild goose lays few eggs generally, and is often difficult to breed in captivity, although as I have said before the cross with a wild gander is being used more and more to get the finest and quickest growing green goslings.

With all but the wild gander trio matings are general and give the best results, although I have known one gander to fertilize the eggs of five geese. During the breeding season the ganders should be confined with only the geese they are to mate with, but after the goslings are well grown you can let them all run together.

Some one has said that cows add greatly to the landscape, but to me even a herd of cows coming home at night does not look so homelike as a line of geese headed by the old gander slowly waddling up from a stream or lake.

Conn. Ray Fisk.

Crow in 19 Days.

I have 100 Anconas that were hatched on the 14th day of March and on the 2nd day of April I heard the first cockerel crow. The next day one of the neighbor poultrymen was in to see this flock and while here we heard two crow. At six weeks I caught about 25 of them and weighed them. The lightest weighed 1 lb., 1 oz. and the heaviest 1 lb. and 4 ozs.

LADY PURITAS

PURITAS SPRINGS S. C. W. LEGHORNS

The World's Greatest Layers

Trapped for over 10 years without missing one day. Every nest on our farm is a trapnest. We trapnest every day of every year.

Big Money in Eggs

8 TO 12 WEEKS OLD PULLETS
THE LAY IS BRED IN THEM—They are Winter Layers

8 TO 12 WEEKS OLD COCKERELS
PEDIGREED—THEY INCREASE EGG PRODUCTION

There is money in poultry if you have heavy layers, the hens that lay large, white eggs in winter. These are the kind that bring biggest profits—they are the Puritas Springs kind. Puritas Springs Leghorns have been trapped for so many years that they can't help but lay. We have a grand lot of early hatched pullets and cockerels that are waiting for you. If you could see them you would want to take them home with you. Please order early as the demand each season is greater than the supply. Send today for our instructive catalog—it tells all about our Leghorns and gives prices.

Purdue Egg Show.

Editor, A. P. J.—

"I fear that you have entirely misunder-
stood the catalog and our method of handling
the classification of eggs, or else you would
not have criticised it as you did. In order
that you may know the facts in the case, I
am writing you so that you can be set right
in the matter.

"We have 'fancy' and 'commercial classes'
of eggs in order that one class may be
judged entirely by weight and exterior and
another class by weight, exterior and also
interior conditions. They do not need to
mean as you would term 'fancy' and 'com-
mercial' relative to poultry, and there is no
reason why we cannot differentiate in this
class with fairness to everyone. It is abso-
lutely impossible for people to ship eggs long
distances and compete with nearby people
when eggs are tested and candled in com-
petition. For this reason the bulk of our
exhibitors have eggs judged on weight, size,
uniformity and exterior conditions. We know,
however, that the fairest way to judge eggs
is on a quality basis which is the strictly
commercial basis and for that reason have
the two classes, fancy and commercial.

"Remember the terms do not involve the
type of flocks, at all, that the eggs come
from, but rather the method of judging
eggs."—A. G. Philips.

Keep Records of Their Breeding.

I must have been born with a love of fancy
poultry, or to be more clearly understood, I
suppose it was a love of producing fancy
poultry. In this pursuit I have spent a good
many years and while the profit in dollars
is easily taken care of in an ordinary bank,
I have gained a world of experience and the
pleasure is all I would ask for. So you see
I am not a failure after all in the business,
if I was a failure as a soldier. It is hard
to conceive why more ex-soldiers do not get
in the poultry business and at least have some
fun rather than take things so gloomy as a
few to my knowledge are doing. This advice
I offer to anyone who is idle, whether it be
an ex-soldier or an ex-anyone else.

My experience as a poultryman has taught
me the value of records and I have been work-
ing out a system for quite a while. However,
I am no futher ahead of you right now than
anyone else, as I am making a new start all
over again. I had a plant before the war,
but let it go to get in the fury, and am just
getting back, and if you want to go along as
I do I would say, "Fall in line," Buddie.

It does not make any difference what breed
you take up, as long as you get one you
like. Personally I took up the Rhode Island
Whites and from a quantity of eggs I got from
the best breeders in this breed, I was suc-
cessful in raising several nice pullets and a
star cockerel. The eggs were pedigreed, that
is they had been marked from certain pens
and I placed the eggs in a wire basket on
the nineteenth day. Each lot of chicks was
toe-punched and a record kept.

Later these chicks were banded with aluminum
bands and when the pullets began to lay trap-
nets were ready for them. Any one can
make these nests from orange boxes by using
the same trigger used on the government style
trapnet. You can get a free copy of this
circular on this trapnet trigger by addressing
the Division of Publication, U. S. Department
of Agriculture, Washington. The eggs from
each of the pullets are numbered with the
same number the hen wears on her leg. I
also write the date on the eggs; all writing
being done on the large end of the egg. The
eggs are set in a regular lamp machine and
on the nineteenth day each lot from individual
hens are placed in little square wire boxes
that fit in the regular tray. I do not use
bags as I find the eggs will sometimes tele-
scope—slip over the end of the eggs that
have not hatched.

The baskets like I use can be made of
hardware cloth or screen wire. Each basket
has the number on it to correspond with the
number on the egg. The chicks are toe-
punched accordingly, and also wing-banded
later with the number of the hen and the
male on its band. These bands are bought
in the blank and the numbers stamped on
them with small dies like the identification,
or "dog tags" for soldiers, were made with.
Of course it is necessary for the numbers to
be small in number of figures. Later when
the bird is matured I use regular large alu-
minum leg bands, and these contain similar
numbers and other information that anyone
can stencil on a band by using a code he
has by memory.

The main idea for this information is to
know the breeding of the bird at a glance
and by referring to the parents of the birds
being considered, one knows all the time which
matings and combinations nick best, and thus
retains the best breeders for next season.

SINGLE COMB ANCONAS

A. M. & O. E. Becker ROUTE 3 VINELAND, N. J.

I also use a series of colored bands to identify at a glance certain birds that excel the others in various sections, not visible. For instance, one can have a special colored band for the birds that Hoganize the best, or another for the late molter. All these details can be worked out and there is not a complicated one in the lot. It is amazing how little time it takes to keep the system in working order, once it has been established.

In my opinion too little attention has been given to complete and accurate records. One sees quite a lot written about line-breeding which I advocate and practice myself. However, there is no such practice of line-breeding without complete and accurate records. In some breeds certain characteristics are transmitted so that one can possibly recognize a descendant from a certain bird, but the percent is small. Therefore, if you would make the most of your time in breeding Standard fowls it will be to your interest to keep complete and accurate records. Once you have started, the work will become so fascinating you would not miss doing it for anything. Personally it led me to naming birds which names appear on certain leg bands to help me call a certain mating when numbers would have to be looked up. It's lots of fun—and profitable. Tenn. Clarence E. Smith.

A Grumbler.

The cynic is a regular visitor at all poultry shows; he is rarely an exhibitor, therefore no hope of gain or glory draws him to the show; he is there to exercise the powers of cynicism it is his joy to possess. He is there while the judges are doing their duties, but he is like the parrot, "says little, but thinks a lot," however though his tongue is still, his ears and eyes are busy. He is gathering material for the campaign of grumbling—disinterested or otherwise that will ensue later on. He notes all the little incidents and small happenings that narrow minds are ready to extract large means from. He is an acquaintance of everybody, though a real friend to none. He claims to be an intimate friend of the judge whose awards he ridicules behind his back. He greets the large exhibitor whose method of progress he delights to analyse and condemn to the admiring small exhibitor who cares to listen. He smiles the smile of sympathy and power when the unsuccessful exhibitor moves towards him; he delights to air his knowledge to the back yard fancier, he knows also how defeat weakens the moral susceptibilities—how it opens the mind and allows it to be receptive for consolation, be it good or evil, thus planting the seeds of discontent and disunion to the detriment of the fancy. The placing of the award cards is his main line of attack; he quotes the standard and effects to show how the judge has diverged from them. He enlarges on the judges want of knowledge and weak powers of interpretation. He champions the cause of birds with a commended card. The secretary and most show officials get their share of his scorn and he is generally a chronic grumbler who soon gets dry from talking and then champions the cause of some bird that is left entirely uncared and finally gets away for a drink with its good natured owner, and during this period engages in much mischievous talk concerning the show management; to sum him up squarely is to dub him egotistical, and his main aim in life is self-glorification. His mind is much above his fellows and he lets you know it.—Austrian Hen.

Turkeys Yield Good Profit.

A return of \$1,525 from turkeys in 2 seasons was obtained by an Oklahoma woman in spite of heavy losses in her flock, due to conditions that might not occur elsewhere. The Greer County extension agent convinced her that it would pay to follow the advice of the United States Department of Agriculture and the State agricultural college and substitute purebreds for her scrub stock. He also gave her information on the management of her flock.

She started with 10 hens and 1 tom of the Mammoth Bronze variety. From these she raised 122 young turkeys, but lost 50 of them in a sudden hail storm. The rest she sold as breeders, advertising them in a farm journal. They netted her \$900, or an average of \$12.50 each.

This year she started with the same number of breeders and obtained 145 young poults. Unfortunately one of the farm hogs was fond of turkey, and destroyed all but 51 of the flock before the depredations were traced to him. At about \$12 apiece, however, the remaining 51 brought \$625.

Other instances of successful turkey raising reported by the extension agent of Greer County shows a total profit of \$2,418.90 on the sale of 210 turkeys and 12 dozen eggs out of 226 turkeys in different flocks. U. S. Department of Agriculture.

The easy, sure and scientific way
with HARZOL and a

PUTNAM VAPORIZER

The Putnam Vaporizer distills the vapor of Harzol into every crack and crevice of the poultry house, destroying every louse and disease germ.

Don't Dust Don't Spray
Do the Easy Way

USE HARZOL

Harzol is a medicated, volatile disinfectant. Its vapor is healing, soothing and agreeable to fowls and humans, but death to lice and microbes. Prevents and relieves colds, roup and other infectious diseases. Set the vaporizer going; it holds a pint of oil and Burns a Week without Attention Does the work perfectly and without effort. Putnam Vaporizer, \$2.50. Harzol, \$1.00 a can. Ask your dealer. If he doesn't have it send me his name and \$3.00 and I will send you complete outfit consisting of one can of Harzol and a Putnam Vaporizer. Harzol is not mailable, so give your nearest express office. Satisfaction guaranteed.

I. PUTNAM

Route 705-V Elmira, N.Y.

Mr. Burton Wants An Exhibit.

Since we announced an exhibit of Standard-bred poultry at Knoxville during the A. P. A. convention, for the benefit of A. P. A. judges, we have received letters from all over the United States congratulating us on this move. Mrs. Florence Forbes has made all arrangements for this exhibit. The convention will be held on the fair grounds and there will be a very suitable building cooped with Keipper coops for the poultry exhibit.

I would like to hear from a number of the large breeders telling me that they will bring along some good specimens for the benefit of the judges working together on a system of more uniform judging. It will be one of the greatest advertisements that could be thought of for the breeders who furnish the birds. The writer will be serving on the Revision Committee in Knoxville on August 4th and any birds shipped there for this exhibit will have our personal attention. Arrangements are already made to care for the exhibit in a satisfactory way. We hope that a number of breeders will take advantage of this opportunity. Walter Burton, Secretary Judges Section, American Poultry Association.

The Young Stock.

At the earliest possible moment the poultry raiser should thin out his flock, with a view to discarding all useless birds and thereby giving greater accommodation to those fowls which are to carry on the profitable side of the establishment. It is very often a great temptation, especially if fertility is good and chickens are hatching strong, to set more eggs than are necessary and to attempt the rearing of more chickens than there is available accommodation. Ruthlessly kill all indifferent specimens, since the remainder will benefit by their room. A change of ground, too, will generally give a fresh stimulus to growth. Thus in a dry season it is wonderful what development there will be if the most promising chickens are taken to rich pastures and orchards, and in a wet one to dry and sunny backs, with dusting places well protected.

The Apiary.

A pound of bees, without honey in them, will number from 4200 to 5600 individuals. The average honey load per bee is about one ten-thousandth part of a pound. To be exact, it takes 10,154 trips to bring in a pound of nectar. Where the flow is poor it takes 45,600 trips to gather a pound. Thus in a colony of 100,000 bees, half staying at home to work on brood or comb, the remainder will have to make 10 trips a day to bring in from one to five pounds per day.

From all this it is readily apparent that strong colonies well fed and in good condition must be in readiness to take advantage of the honey flow when it does come.

Controlling Gape Worms

After having experimented with every method suggested to me by poultry raisers in regard to subduing the deadly gape-worm that always wrought such havoc among my chicks, I decided to try to avoid the evil entirely. By working along the theory that the gape-worm is like the common angle worm, and taken into the chick's nostril in the egg or larva state when the chick begins to scratch in the earth—hence the violent sneezing during the first stages of the attack. Chicks running with the mother hen are most liable to be troubled with this malady, as the hen is continually scratching and wallowing in dirt. So I always remove the chicks when first hatched. When strong enough I place them in pens constructed in the following way:

Using inch-mesh wire fencing I built pens 5 ft. wide and 20 ft. in length. These pens I built along a fence of the same grade of wire, thus economizing in material. I selected as high, well-drained location as possible, and after raking every particle of litter and dead weeds from the ground I sprayed it well with kerosene and sprinkled every inch with lime and ashes.

I secured store boxes of ample size and height, to prevent crowding as the chicks grow larger. In each box I cut an opening for door. I nailed cleats across inside of lid to make it more solid. Upon the outside I tacked tarred roofing paper, or any roofing material handy. Then I nailed strips of thin board around the edges of lid as a rim to be fitted down over the desired slant when roof is adjusted. When the box is to be cleansed the lid is taken off allowing sunlight to dry inside. I finished these sleeping quarters by nailing four legs to each box, lifting it about

Cut Feeding Costs - Triple Your Egg Production

Use the methods of progressive poultry farms to increase egg production and cut feeding costs. Feed—NOT DOPE—for more eggs and healthier flocks. Scientific tests—described in Purdue Bulletin No. 258, sent free—prove solid buttermilk triples egg production, makes a bigger profit. Makes a faster growing chicken—easier finished for market—bringing top-market, milk-fed prices.

How to Build Poultry Houses

A new book just out, devoted exclusively to the building of poultry houses of all kinds and descriptions. Besides telling how to build the houses properly it tells how to make feed troughs, nest boxes and water troughs. It gives complete plans, as well as the approximate cost of construction. It also contains plans of roosts and dropping boards; the brood coop; the brooder house; the fattening coop; the winter American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

Diseases of Poultry

By D. E. Salmon, D. V. M. Every poultryman needs this book. It contains 250 pages, treating in a thorough manner every disease fowls are subject to. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. The cure of all diseases is plainly and thoroughly given. 72 illustrations. Price, \$1.00, postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago

AUTO OWNERS
Save half of your tire cost by using Double Mileage, Double Tread Tires, Guaranteed 6000 Miles. We lead, others try to follow. They are reconstructed of highest grade material—hardly ever blow out. They are only guaranteed for 6000 miles, but have run from 8000 to 10,000 miles. Order today at these low prices:

Size	Tires	Tubes

six inches from ground. A piece of board reaching from the ground to the doorway serves as ladder.

I placed about forty chicks in each pen. They were furnished plenty of water, green food and fed regularly. Twice a week I went over each pen with kerosene and lime and ashes. There was not one case of gapes. Out of each lot of forty chicks there was an average loss of two. At the end of eight weeks I turned them upon the range with other fowls and they were considered the handsomest flock in the whole neighborhood.

Chickens hatched prior to May would be apt to be chilled if housed in these quarters. There should never be more than two weeks difference in the ages of chicks confined in the same pen.

Md.

Stanley Radcliffe.

Feathers and Their Growth.

The natural process of renewing the feathers is perhaps the chief concern of poultry-keepers at the present moment. Undoubtedly the hot, dry summer through which we have passed has caused many early moults, but, as a general rule, moulting does not take place until about the end of August and September, and it is a recognized fact that the most valuable birds do not moult until late in the season. Take, for example, the hen that has the highest individual egg record of the flock, ninety-nine times out of a hundred it will be seen that she is a late moulter, and it is very often the case with a large number of the best exhibition birds which requires attention as regards their feathers at this time of the year, and they are the youngsters which are entering upon their adult plumage, says Searchlight in Feathered World, London.

Perhaps it is not usually conceived that the feather is a "hardy annual," yet it is so, and if poultry-keepers would bear this in mind there would be fewer protracted molts than there are now. A rapid moult means a success commercially, whether birds be kept for exhibition breeding or egg production it may appear difficult to treat feathers like flowers, but yet it is simple if one remembers that the bird is the soil from which the feather grows, derives its sustenance, and eventually dies to make room for a new growth.

The importance of proper treatment during the growth of new feathers is vital to the success of the branches mentioned above, and to them we may add table poultry. Anyone who has killed and plucked many fowls knows the difference it takes in time and trouble in preparing a quantity of fowls that have been improperly treated to a number that have been correctly reared, the difference being noted not only in quality and profusion of feather and ease of plucking, but in the difference in the size and flesh of the bird. In a nutshell, the secret of good plumage is keeping the birds in good condition right from the time they are hatched.

Feathers act as a protective garment to the fowl from the weather. Thus it is evident that a good growth of feathers means warmth in the cold months of the year, and warmth in the winter means winter eggs. Nature has provided birds with the lightest yet warmest equipment that is possible, light owing to the bird's great activity, and warm because of its small size and great productivity. Yet the bird can adjust this covering to a very large extent to meet the requirements of the weather, and note the difference.

Feathers do not interest the utilitarian as they do the exhibitor and breeder of fancy fowls, for this class of poultry-keeper depends almost entirely upon the colour and marking of the feather, whilst the fatterer, beyond their market value, considers feathers, as the writer has done on many occasions, a general nuisance. "But what can't be cured must be endured," and the advice we give to the poultry-keeper who cater for the table chicken is to grow white feathers, as they command the best prices. There are many varieties and forms of feathers, yet their composition is the same; feathers are made up of quill, shaft and web. The quill is the horny tube which attaches the feather to the skin. It has a small opening at either end, where it is attached and where it merges into the shaft. The nutrient vascular pulp is contained in this hollow tube during the growing stages of the feather, which it draws from the body to feed remaining portion of the feather. When the feather is fully developed the inside of the quill becomes by a gradual process empty, the pulp or sap which it contains is drawn into the feather leaving nothing but a dry, shrivelled pith. At this stage the feather is no longer nourished by the body, because the bird is

TRAP NESTS

of Neimann Make are Best

Galvanized Iron nests are positively sanitary and in purchasing such a nest you are rendering yourself a service that will pay for itself in a short time. Why run the risk of having your birds become infested with lice and mites when you can buy a galvanized trap nest that is positive proof against parasites? The same is true of every Neimann product. Our Products are all made substantially of galvanized iron, are easily taken apart and packed for removal and the prices at which we sell them make their purchase the most economical way of securing fixtures. Write today for catalog showing prices of these attractive poultry fixtures.

Poultry Books at a Cut Price

A complete poultry library that covers every phase of the industry. \$5.00 complete poultry library for only \$5.00. A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and by taking them all at a cut price, you will be well equipped to make a success of this business.

Save One-third by Ordering Six or More of these Books Now

How to Raise Chicks, by Dr. Prince T. Wood. A down-to-date manual on breeding poultry, getting hatchable eggs, incubation and brooding, both natural and artificial, preparing chick foods, feeding chicks, how to raise chicks and how to avoid and prevent diseases and losses. Tells how to make your own brooders and chick foods. 128 pages, 35 illustrations. Price 75c postpaid.

999 Questions and Answers, by Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information and right to the point. 124 pages. 75c postpaid.

Poultry Account Book. This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. A guide to making your business more profitable. Printed on paper suitable for ink. Price 25c.

Open Air Poultry Houses for All Climates, by Dr. Prince T. Wood. Tells plainly just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by successful breeders. 75c postpaid.

Origin and History of All Breeds of Poultry. Tells you where the breeds originated, what varieties were crossed to produce certain qualifications in a new breed; how they were recrossed until perfect. Postpaid, per copy, \$1.00.

A Revolution in Egg Production, by George C. Newell. Read this book and learn how you can lengthen the hen's working day in winter by the use of lights in the hen house when egg yield is lowest. It shows how you can increase the Winter egg yield 100 per cent. Cloth bound, \$1.00 postpaid.

\$4223.00 In One Year on a Town Lot, by H. Cecil Sheppard. Shows how with a very limited knowledge of the poultry business and small capital, he built up a profitable business. Cloth bound, price, \$1.00 postpaid.

Diseases of Poultry.—Every poultryman needs this book. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. \$1.00 postpaid.

How to Build Poultry Houses.—A new book entirely different from our old book of similar name.—This new book presents the latest approved house designs of those state colleges and agricultural stations that have done noteworthy work along the big educational line of poultry house construction. This book contains the designs of those leading agricultural stations which have had the opportunity to study the problem in a big way for all poultry keepers. No one who is going to invest in lumber or labor should fail to secure this book. Handsomely bound in paper. Price 75c postpaid.

Why Poultry Pays and How to Make It Pay.—A book for the beginners in poultry raising and those who are interested in securing from the business the greatest profit obtainable. In this book you will find a complete discussion of the fundamentals that underlie success: the foundation stock; science in breeding; early hatching; chick trouble; importance of open air housing for growing chickens; early laying; artificial illumination to increase winter egg production. Paper bound and printed on special paper. 75c a copy, postpaid.

Cut Price for 10 Books \$5.00—Average 50 cts Each

Announcement

Albert Angell, Jr., life-long poultry expert, author and lecturer of national reputation and well known throughout the poultry world for his ability in formulating feeds for growing chicks and securing eggs, has been secured by Rosenbaum Brothers, Chicago, to establish and manage their Poultry Department. It will be remembered that Mr. Angell originated the name "Ful-O-Pep" and formulated the feed sold under that brand by the Quaker Oats Co. Rosenbaum Brothers need no introduction to the grain business, having been established on the Chicago Board of Trade for over 50 years and known far and wide as "The House of Integrity."

Four years ago Rosenbaum Brothers decided to enter the field of commercial feeds and have since erected one of the most modern concrete and steel milling plants in the United States. It was the original intention to make progress slowly and build up an organization second to none and finally offer to the poultry world **THE MOST SCIENTIFIC AND PROFITABLE FEEDS THAT CAN BE MADE.**

The following is quoted from a recent announcement by Rosenbaum Brothers.

"The logical selection of a poultryman to formulate these feeds and assist the poultry raisers in getting out of their flocks all that may be in them in profitable returns, was Albert Angell, Jr., because of the high reputation he bears wherever poultry is raised."

So convinced are we that Mr. Angell deserves the reputation he enjoys that we do not hesitate in admitting that he is also the highest priced poultry expert in the country.

Having thus secured the best talent to be had regardless of cost, we, Rosenbaum Brothers, stake our reputation of 53 years in the grain business with Albert Angell, Jr., and assure the entire Poultry and Feed Fraternity that in actual results obtained his feed formulae cannot be duplicated.

Mr. Angell is now at work on the masterpiece of his life in poultry literature—is writing page after page of the very material he is made of—**ORIGINALITY IN POULTRY FEEDING AND MANAGEMENT.** We know nothing of the nature of the surprise he is to make known for the first time through the pages of his new book, but rest assured that what this expert puts his name to will be backed up by Rosenbaum Brothers.—Advertisement.

making preparation for a new growth of feathers. This prevents the old feathers from obtaining nutriment, and causes their death and falling out. The young ones take their place, and they in their turn go through the same stages. Nature thus replacing annually the old worn and torn garment by a new one which the bird requires to withstand the cold months of the year. It must be obvious, therefore, that the better the condition the bird is in during the growth of feathers the better they will be, not only in quality but also quantity.

The shaft of the feather is a continuation of the quill. It is a spongy structure beneath a thin horny covering. In shape it is flat sided, with a convex back, and grooved on the underside. From these flattened sides spring those delicate fibres called the web or plume, and also the fluff. This web, etc., consists of numerous barbs interlocked by means of minute processes termed brabules; in many feathers the base of the web consists of loose free soft barbs. This is, of course, the fluff. Few poultry-keepers take the trouble to examine carefully the formation of their birds' feathers; a feather when closely examined, especially by the aid of the microscope, is marvelously formed. The hundreds of small fibres is simply astounding, and each barb is practically another small stem attached to the main stem. These barbs gather, as we have previously seen, their life from the main stem, and their colouring and that of the fluff are derived from pigments existing in the blood of the birds.

There are various sizes and shapes of feathers, and, as might be expected, there is usually a marked difference in the feathering of the sexes, and often breeds. But in general the feathers peculiar to different parts of the body follow a similar outline. The names of these different feathers are familiar to the "old hand," but for the benefit of the novice we give a description of them here. The long, narrow, pointed feathers of the neck are termed neck hackles, and those upon the posterior portion of the male's back, which are more tapering in form than the neck hackles, are called saddle hackles. The saddle of the cock corresponds to the cushion of the hen. The true tail feathers are the ones that stand out straight and stiff in the tails of both sexes, but the large curved feathers of the tail in males are termed the sickles. The softer, smaller, curved feathers at the sides and bottom of the tail are the tail coverts. The first 10 flight feathers of the wing are the primaries, the next 10 (approximately) are the secondaries. These cover the primaries when the wing is closed. The secondaries are often termed the wing-bay when the wing is closed. The wing bow is composed of the feathers on the entire shoulder part of the wing. The broad feathers which spring from beneath the wing bow and cover the roots of the secondaries are the wing coverts. The marking of these wing coverts is usually termed the wing bar. The characteristics of the breast feathers are similar to the neck and flat of the wing.

Our Cover.

Rarely has a picture of a more typical Columbian Wyandotte male being presented to the public than Artist Schilling has furnished for the front cover of this issue of the Journal. Here you have that well modeled Wyandotte form which all judges pronounce "good." The head is crowned with a neat, rocker fitting comb, nicely pebbled. The neck is nicely arched. The back is not too short and sweeps gracefully to the tail. The tail is carried at the right angle to complete the true curves of good Wyandotte type. The main tail feathers are well spread, and nicely covered over with sickles and tail coverts. The breast and body show a fully rounded underline, indicating a bird of good substance. The wing is properly carried up, and the underline of the wing is horizontal. The legs are of proper length. They are nicely spread apart, indicating not merely firm footing but good breadth of body.

In color, you see the correct markings of this beautiful color-type. A broad neck feather gives ground for a broad stripe through the web of each hackle feather. The black markings in the saddle run from the lower saddle feathers over points of wing, up onto tail. The top of the back is clean. The tail is a lustrous, greenish black.

Standard weights for Columbian Wyandottes are: Cock, 8½ lbs., hen 6½ lbs., cockerel, 7½ lbs., pullet, 5½ lbs. Some birds run smaller than these weights to the detriment of the variety. The Standard weight for Wyandottes is not excessive, is easily attained, and judges error when they place small birds merely because of strong color properties. The females lay brown shelled eggs.

MAKE BIG MONEY WITH POULTRY

I will show you more secrets, useful and helpful poultry information, in a week than you can get in a year in any other way.

I'll show you how to tell slackers and poor layers and cull out the non-producing hens. How to avoid white diarrhea. How to prevent death in the shell. How to secure better hatches under hens or from incubators. How to raise chicks and insure quick and strong growth. How to keep a flock in good health and to avoid and treat diseases. How to feed and care for breeding birds to insure good fertility and strong hatching eggs. How to get more eggs and save feed bills. How to balance your ration so as to produce the greatest number of whites.

WANTED.

WANTED FREAK ANIMALS and birds. Apply Browning Amusement Co., Riverview Park, Chicago, Ill. 6-11

KILL LICE THE BEST AND SURE WAY

Protect your fowls from the powerful and insidious lice and mites that suck the life-blood of your birds.

These parasites allowed to run rampant in a hen house will suck more blood, more vitality over night than fowls can replace by the assimilation of large quantities of food during the day—think this over.

Extra care must be taken that not only the birds are kept clean, but every crack and crevice as well.

Licecil

Kills Lice

**No dusting—No dipping—No painting
—Just hang up the bottle**

—and in a few days your entire flock and hen house will be rid of every louse and mite. Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

How to Use Licecil

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

1 Bottle, \$1.00; 3 Bottles, \$2.50; 12 Bottles, \$9.00—All Postpaid.

American Supply Company, Dept. 54, Quincy, Illinois

Chicken Mites Filled With the Life Blood of Faithful Hens.

THE END.

Evidence!

KEEPS ON USING LICECIL.

Please find checks for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.

J. D. ALLEN, Lynchburg, Va..

WANTS MORE.

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am out now.

JOHN HOLTRAP, Lynden, Wash.

KEEPS ON USING IT.

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.

J. E. PLATT, Maywood, Ill.

LITTLE WORRY OR WORK.

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.

BERNARD F. OSTERFIELD,
Dayton, Ohio.

SEND MORE.

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.

L. G. STAYNOS,
Sherman, Texas.

Specimens of the
FUL-O-PEP Strain
Buff Orpingtons —
bred by The
Quaker Oats Co.

ARE YOUR HENS NOW LAYING

THE reason most flocks drop off in egg production at this time of year, is due to several causes. First, they are going into the moulting season—second, the bugs, worms, green grass that they have been picking up plentifully during the spring and summer, are now getting scarce — third, and probably the chief reason, is because hens are not getting enough feed, nor the right kind of feed.

This prevailing condition cuts down poultrymen's profits. Since egg prices go up at this season 50% production now means more profit than it did in April or May. You can keep your flock up to 50% production right through the season, if you will follow the Ful-O-Pep Way of feeding. Don't expect your hens to lay on the few bugs, worms, etc., that they can pick up now. This will probably keep your hens alive, but it don't supply biddy's egg making machinery with sufficient material to make eggs. Keep up the egg production of your flock by feeding them

FUL-O-PEP DRY MASH

It supplies just the proper material to make eggs. Feed it heavily—keep it before them all the time—during the hot, dry weather give them a special feed of the mash at noon—mix with water or milk into a crumbly condition and feed in a cool shady place. For the last meal of the day feed them FUL-O-PEP SCRATCH GRAINS. This method of feeding will keep your hens laying—keep them in good flesh — will postpone and shorten the moulting season, so that they will lose only two or three months in egg production instead of the usual five or six months. Give the Ful-

O-Pep Way a trial this season. See how it will keep up egg production in your flock—shorten the moult and increase your profit.

Take Advantage of Our Free Poultry Service Department

We have an extensive corps of poultry experts who are constantly studying and working out poultry problems. At the head of this department is Professor O. B. Kent, formerly of the Poultry Division of Cornell University. We want you to feel free to use this poultry service department—ask as many questions as you wish. Our aim is not only to make the best poultry feeds, but also to give the best help that can be rendered. Remember this service is free to everyone.

of World Famous Holterman “ARISTOCRAT” Barred Plymouth Rock Prize Winning Stock

My long-established Summer Bargain Sale of Producing parents of Prize Winners continues only until my last surplus “Aristocrat” breeding bird is gone. Each year the fame of this Holterman Bargain Sale at unbelievably low prices has continued to spread and this year will no doubt see these scores of powerful producing birds entirely disposed of in a very few weeks. Remember, that every bird represents a standard, fixed value, given to you at a tremendous discount from my normal prices.

You Actually Save 20-40% Off AND BELOW MY CATALOG PRICES

The name “Holterman” bears an international reputation as a breeder of world winning Barred Plymouth Rocks, painstakingly developed by my own methods and resulting in birds of supreme excellence, known to the world as my “Aristocrat” strain. They are unquestionably the biggest profit-producing birds ever bred. The very greatest of all my “Aristocrats” I use for producers—for the production of chicks that become equal and better than their parents. And each year I replace some of these famous parents with the very best of their own wonderful offspring. This gives other breeders the yearly privilege of getting some of these great producers of Prize Winning and Record Laying stock, while I, in turn, advance the quality of my breeding flock with young birds of my own thoroughgoing selection.

Why These Astonishing Bargains Are Grasped So Quickly!

See my guarantee above! Remember, my great offer has been snapped up each year, again and again, by the same people. Then remember my huge file of letters from breeders the country over who state, over their signatures, that my values at bargain prices are not equalled anywhere in the poultry business! For your benefit I have outlined every fact regarding this Great Summer Bargain Sale of “Aristocrat” Famous Produ-

W. D. Holterman, Fancier,

MACKEY MULTI-CABINET

The Incubator You've Hoped For

As a chick producer you have long hoped for an incubator that is free from tricky kinks; that works right, day and night, whether you are on the job or not; that cuts down your labor and responsibility; that is compact without sacrificing efficiency; that regularly turns out big hatches of chicks you are glad to own and proud to sell.

That dream has come true!

The MacKay Multi-Cabinet Incubator—the product of the experience, skill and genius of Jack MacKay and his capable associates—is the incubator you hoped for.

You will find it worth while to carefully investigate before you order any hatching equipment.

A letter or telegram will quickly bring you the facts and details concerning any desired egg-capacity.

ORPINGTONS

**Bufs
Whites
Blacks**

Perhaps no State or Provincial Show is held in the United States or Canada where my Strain is not represented among the First Prize Winners. That has been and will continue to be the case for this is a permanent, constructive breeding establishment where beginners as well as old breeders depend on strengthening their exhibition and breeding lines. Scores and hundreds of testimonials unfold the good and proper reasons for seeking this source of supply. It is said that ninety percent of wisdom consists of being wise in time.

The early purchaser will get the cream of my big, finished young stock and adult birds in prime condition to win at any State Fair or State Show. Recite your requirements clearly and get my Catalog and Special Sale List.

*Every Hatcher finds he
can Make Most Profits
with Wishbones ~*

HATCHERS buy Wishbones because they are not dealing in the unknown—the untried. They *know* the Wishbone has stood the acid test of time, and year after year continues to make more money for the user. Always the Wishbone has hatched better chicks—chicks of higher vitality—chicks that live and thrive—and today it is hatching them at a lower cost than any other incubator.

The 1923 Wishbone is better than ever! *All hand labor is eliminated*—no transferring of eggs—no removal of trays. Simply put the eggs in—the Wishbone does the rest.

You can handle more than twice the capacity that you can handle with any other mammoth. If your space is limited, Wishbones will give you most egg capacity. Send us height, width and length of incubator house and we'll prove it.

Wishbone hatched chicks are famous for their high vitality. They bring higher prices—hence Wishbone users make the biggest profits. You owe it to yourself to get into this money-making class. Start this season with a Wishbone.

Send for the New Wishbone Catalog

Learn about the new Wishbone rolling and hatching tray that rolls every egg just as the hen rolls it and yet provides a perfect hatching floor. Learn about the heater that uses soft coal, hard coal, gas or oil, and cuts fuel bills in half. Study the construction and labor-saving devices, all of which are explained. You'll want to read all about them. Write for this handsome catalog today.

Owen Farms

**S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS**

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the world. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their pre-potency, stamnia and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come back each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

1922 Youngsters

are rounding into form very rapidly. You will find here fine husky, perfectly grown January hatch cockerels and pullets in prime shape for August and September Shows. Fully finished pullets and cockerels almost in full feather. Good show cockerels and pullets at \$15.00 and \$25.00 each. Extra good cockerels at \$35.00; \$50.00 and \$75.00 each and pullets at \$35.00 each. A few wonderful birds for the hot-test shows a matter of correspondence.

Selected utility cockerels at \$7.50 and \$10.00 each, with a discount of five or more and pullets at \$4.00 and \$5.00 each. These fine early breeders will not last long. Better order now.

Half Price Adult Breeder Sale

has gone nicely, as usual. You can still find the exact birds you need for next year at one-half their value May first. Take advantage of this summer sale and secure tested breeders for next year. Customers of other years have already had their orders filled.

Owen Farms Service

will mean a lot to you if you will use it. Your requirements will be carefully considered and I will select every bird that goes to you as close to your specifications as possible. A complete record is kept here of every shipment and you can secure just the proper birds from time to time to carry on your breeding. Come here to Owen Farms, if you can. Will talk to you on paper exactly as I would were you sitting beside me at my desk. Tell me your problems and let me help solve them. If you will tell me frankly just what you need and what you can afford to pay, my reply will frankly tell you exactly what to expect. My long experience is at your disposal and will be freely used for your benefit. Write today and find just what it will mean to you to have help from Owen Farms.

No. 8

WHEN TO CULL AND HOW TO CULL

TO cull? Yes, of course. Culling is a comparatively new term in the poultryman's vocabulary. But it is a word that the modern makers of Webster will have to include in their dictionary if that famous book is to be up to date and correct. Culling is a term that will be used more and more as years go by and its full meaning and significance to the poultry industry becomes more clearly appreciated. Culling is simply the application of sound sense and business to the hens. It means going over the stock as the producing year wanes, eliminating those birds which have not produced efficiently or profitably, and weeding out those which give no promise for future economical production. It is a practice which must be followed on every farm and in every flock that is to be maintained and operated on a paying basis. It is becoming simply one of the various procedures to be gone through with in order to establish the poultry flock as a money-making enterprise. As one of the important points which this article would bring out the writer would emphasize the statement that culling is a normal, economic business practice to be made use of by every poultry raiser in the country to a greater or less extent, and that it is not just a term of interest to, and coined by, the so-called utility poultrymen. Culling is a practice that has just as definite a place in the round of a poultry raiser's duties as incubation, brooding, the feeding of the fowls, or gathering of eggs. It must be viewed in this light, and then can it be made a factor of importance in the improvement of the industry in which so many thousands of American people are engaged.

Culling—Or the Trapnest?

In the experience of the writer one of the first questions which arises after an argument in favor of culling is proposed has to do with the relation between culling and the use of the trapnest, especially on those poultry farms which are more or less poultry breeding establishments. And by the bye, at least the great majority of poultry flocks of purebred fowls should be breeding establishments, meaning that a more or less systematic method of breeding and mating should be in practice with the aim of improving and bettering the quality and productive capacities of the birds year by year. There is, perhaps, a relation between culling and trapnest. It is scarcely a direct relation.

Under ordinary, or average, conditions it is not economical or wise, perhaps, to place more than a limited number, perhaps from ten to twenty-five per cent of the pullets or hens, under trapnest, because of the inhibiting effect of the labor involved. Trapping a small number of the best appearing pullets each year will yield a nucleus of recorded and known hens for use as breeders in the succeeding year. From such trapnested females can be produced males of great value and pullets of greater worth, because of their known pedigree. This

By Willard C. Thompson

Culling is one of the big advancements in modern poultry keeping—It has become as much of the poultryman's job as hatching and rearing.

is a recognized business method for the progressive poultryman to use in building up his strain, for whatever purpose he may choose. And this business of trapnesting and accurately recording the production of the better individuals in the flocks should, in no way, be interfered with by the system of culling which in these re-

cent days has been talked of as a great assistance to the poultryman who would increase the efficiency of his flock production. And this is no argument against the practice of culling, but rather a more emphatic reason for it.

Culling is a separation of the entire flock into two groups of hens,—those which are adjudged to be loafers and those which are in all probability paying their way and interest besides. Culling should be applied to all the hens in the flocks. Trapping can, in most cases, be applied to but a limited number. The two do not conflict in plan or purpose. The man who traps also culls.

When to Cull

There is usually a best way to do things, and often this best way is too complicated or expensive for use in its entirety. Now, there is a best way to do culling, undoubtedly. Authorities may disagree as to what this best way may be. In fact the best way for one poultryman may not be the best or most efficient way for another. Be that as it may, the writer suggests the following as his idea of the best way, to be used as closely as local conditions may permit. Culling should be commenced as soon after the spring season of normally heavy production has commenced to slow up a bit as the fairly unmistakable signs of non-production appear in various individuals in the flock. In some cases this may be as early as late May or early June, and in other cases there may be little culling to do before along towards the middle of July or even in August. Circumstances alter cases. Much will depend upon the development of the laying flock. If it is the product of years of selection and mating, naturally the culling will be less severe and start somewhat later in the season than as if the flock had never been built up by such methods in previous years. Perhaps a few simple rules might help to get a clear idea of when to cull:

Begin to cull when hens stop their season's production.

Watch the flock day by day for the appearance of hens that undoubtedly have stopped paying their way.

Go over the flock about the middle of June, taking out the hens that have undoubtedly stopped laying at that time.

Go over the flocks again at intervals of about three weeks until September. If time and labor do not make these rather frequent cullings possible, plan to cull about the middle of July and again along well in August and then a final selection in October.

Plan the time of culling accord- (Continued on page 810)

Turkeys As a Profitable Source of Income

TURKEY growing is not a business for backlotters. The birds are big and they are not adaptable for confinement in small runs. Turkeys are the product of the farm, especially suited to farms of good size, where there is woodland and range and little danger of bothering neighbors' fields or being run down by autoists. Turkey raising, as ordinarily engaged in, is a side line upon the general farm, but of all branches of poultry keeping, raising turkeys is perhaps the most interesting, as well as the most profitable, and in these days of depressed buying power on the farms, this latter feature makes it all the more interesting.

Of the several varieties the Bronze has won its way into popular favor more so than any other variety, and justly so, it would seem, when we consider their many excellent qualities. The Bronze possess the handsomest plumage, attain the largest size, take on fat readily; while the young poults are healthy, hardy, grow rapidly and are easily raised.

I have been raising a limited number of the Bronze beauties for a good many years, and in a measure, have been successful with them. Have always been able to win my share of the honors when I showed, and am never able to supply the demand I have for stock.

To be successful with any kind of live stock, one must consider their nature. If chickens, they do not need so much territory to be raised in; water fowls do best where they can have pure running water; so must turkeys have the right environment, which consists of almost unlimited range to grow to perfection and do their best. They can not attain their best in size and plumage when raised in too large numbers or in limited quarters. Although to a great extent domesticated, they still retain some of the instinct of the wild bird, and this fact must be recognized by those who desire to make a success of turkey raising.

As to shape or type and color of tom and hens to breed from I am particular to have a very robust, husky tom of very upright and rangy carriage, one that carries his breast high, the same to be moderately full and well rounded. I don't want one that carries his breast level or low. That kind is apt to prove a disappointment. I want extremely heavy bone, good body depth, extra width across back at shoulders, big head with bright eyes, big feet and long shanks and as nearly perfect color and markings as I can get, as I believe the tom influences the offspring more in shape and color than do the females. I want the beautiful golden bronzing in all the sections, reaching well up the back, with white edging where it belongs as called for in the Standard. The females I want to have that good upright carriage, with big heavy frames and all the size I can get, together with the best golden bronzing and markings. I think the females have quite a bit of influence on the size of the offspring.

Now, with the breeding stock not akin and not

By **MRS. V. B. PETWAY**

The Turkey check is a welcome guest at holiday time—Little bells on mother turkey hens to locate the brood—Feed and care.

inbred and properly mated and properly fed so as to be not over-fat, we may expect eggs that will hatch husky poults that, with the proper attention at first, should be easily started on the road to maturity. Have the hens free from lice by liberally dusting with London Purple or some good insecticide when they

are set and again when they hatch. When it is convenient, I like to set two hens to hatch at the same time, thus having two broods to go together, as they seem to fare better that way.

Starting the Young Turkeys.

After they are through hatching, I leave the poults without any feed for 24 to 48 hours, as nature has provided the yolk of the egg for their system to absorb and subsist on for that length of time. I have nice roomy coops that take two broods each and keep them protected from dampness and cold, and this is one of the secrets in raising turkeys; keep them warm and dry and the chances are in your favor. I put the hens in the coop and feed them and take the poults into the kitchen where they are put into a large pan or tub lined with some woolen cloth and placed near the range so they will keep warm and comfortable.

I prepare their first feed thus: break a fresh egg into a small vessel and beat slightly; into this I put two tablespoonfuls of sweet milk and stir to mix. Set on the stove and cook to a thick custard, stirring occasionally to keep from scorching. This makes a complete food, and is the best starter for little turkeys and all little fowls I have ever found. I may add a dash of black pepper to this if I wish, especially if the weather is damp and chilly, and a few alfalfa leaves and onion tops chopped up and added are greatly relished by the little turkeys.

After a few days corn-bread is substituted

for the egg with perhaps now and then some cottage cheese, and may be a hard boiled egg chopped fine. Commercial beef scraps of the best grade mixed with their feed in very limited quantities is very beneficial. Remember to feed often, but a very little at a time. Overfeeding is almost sure death. This point is not sufficiently understood. See that they have good clean drinking water in shallow vessels all the time.

Above all keep them clear of lice and all vermin, or your work will all be for nothing. They positively can not live with lice sapping their very life blood from them. Grease the down on top of head, under wings, under throat and at vent with the tiniest bit of lard, corbolated vaseline, or sweet oil. Don't use enough to blister the tender skin, and repeat this every week, preferably just before they go to roost at night. The deadly black head lice will work havoc with an otherwise healthy lot in a surprisingly short time, so keep a sharp lookout, also dust the mother hens every week or ten days.

As soon as they are a few days (Continued on page 811)

Bronze Turkeys on Farm Range.

Standard Quality in Partridge Wyandottes

THE breeding of good poultry is not a subject that can be reduced to a few simple points and summed up in a few words. It is a subject that calls for a conception of what is beautiful in color and symmetrical in form, a careful selection for mating of the actual living birds that are available in your breeding yards, and then a pedigree record of the chickens they beget. Only in this way of dreaming of the ideal, in working carefully with the available material, and in keeping a record of results produced to learn from whence progress comes, or where error may lie, does the breeder learn the breeding tendencies in his flock. That is the substance of success in breeding.

Anyone by applying thought to the breeding problem can rival, if not excel, the great breeders of today or yesterday. You have the same varieties with which to work—the same air charged with oxygen for your birds to breathe, the same food nutrients to nourish the birds, the same mother earth on which the birds may be grown. What the breeder does, what he accomplishes, is therefore a personal matter with him. And it is largely a matter of his ability to dream true, to work methodically, to think. This is the formula. Apply it, and then perhaps some customer, who has never lost a show with a bird purchased from you, will write, when ordering winners for a fall fair: "Why don't you borrow this from Kipling for the first page of your next catalog:

"And they ask me how I did it, and I gave them the scripture text: 'You keep your light so shining, A little ahead of the next.'

They copied all they could follow, but they couldn't copy my mind, and I left them sweating and stealing, a year and a half behind."

I shall be happy if in this article I can strike a light that will light the lamp for you. It is then for you to keep it "shining a little ahead of the next."

Slight differences in mating will always be necessary with different men working with different strains. H. B. Hark, C. E. George and Paul Cahow, each a familiar name to Partridge Wyandotte breeders, mate differently. All three are most successful breeders; still my system is different from theirs. Of others I cannot speak for in some cases I have not seen their matings and in other cases birds from different flocks are mated together without breeding records.

In our own breeding institution we have cut out all double matings and disposed of all birds used for such, for we always bred just as good birds, as measured by my interpretation of the Standard, by single mating. I take it that it should be the aim of all good breeders to endeavor

By T. W. SCHOEN

Truly great breeders are single maters—Double mating leads to double standards—Major factors in breeding Partridge color.

to produce both their Standard exhibition males and females from the same mating. The National Partridge Wyandotte Club has endeavored to work along these lines in recommending changes in the Standard. A Standard that requires two separate matings to produce what it

describes as the Standard male and female, is not a true Standard; rather, it is an arbitrary, artificial one. The Standard Committee, outside of a little unpleasantness in the heat of debate seems to me to have shown good judgment on the whole, in working along the lines of single mating as applied to so many of the parti-colored varieties. It should not be assumed that single mating means simple mating. The simple thing is to split a variety in two parts, and have cockerel and pullet matings. That is the line of least resistance. Single mating means science in breeding that is founded on a scientific Standard, a Standard that takes into consideration these natural breeding tendencies that are fundamental. A man who attains such national fame as Geo. W. Mitchell, who defeated the western breeders of Partridge Cochins at Indianapolis in 1888, and defeated eastern breeders time after time, up to and including his clean sweep at Boston in 1921, deserves by far the greater credit for having produced his marvelous pen-

ciling and tones of color by single mating. Back in the early years, competent judges said: "It is too difficult—you can never do it." He did it.

The more I learn of Mr. Mitchell's methods of mating the more I find myself in harmony with his principles and practice.

In 1916 I started to boost for a lighter, brighter colored female than was then winning as the accepted Standard mahogany colored Partridge Wyandotte female. A storm of protest was thrown against me by fellow breeders, so I had to quit agitating on the female side, and swing over and join the minority that was already working for a brighter colored male with a level shade over wing, back, hackle and saddle. I knew that in single mating this kind of male, he would give us the brighter females which I so much wanted to see popular. It looked as if I were to win my point indirectly.

I did not dream then that some breeders would develop a dark female line, or a line "with pullet breeding tendencies" and make their prominent winnings on females only. That has been done. It is not in harmony with Mr. Mitchell's female color. It is not in harmony with his system of mating.

The Standard Committee has recommended the appropriate color term "deep, reddish bay" for the female color. With "bay" in the female description we are a step nearer popularity for our breed. It means a rich ground color, (Continued on page 811)

Unretouched photo of beautifully penciled Partridge Wyandotte hen, dam of the 1st prize cockerel at Toronto and New York, 1921. The feathers are from that cockerel and show the brown shaft in center of stripe. About 25 per cent of his saddle feathers carry the brown quill. Oke judged at Toronto, and Drevenstedt at New York.

Need of Well Balanced Type in Orpingtons

WILLIAM COOK'S object in originating the Orpington, of which he used the Langshan as a foundation, was to get a large bodied, clean-legged, black plumaged fowl, capable of laying more eggs than any other variety bred at that time.

For several years after the introduction of the original Black Orpington, the originator declined exhibiting, well knowing that shipping birds by express to shows, where show pen excitement, irregularity of diet and other effects incidental to exhibiting poultry, would prove detrimental to the cultivation of a better laying fowl,—his own words on this subject being as follows:

"The show pen will always have a strange fascination for many; the fancy will always hold its votaries in obedience, but the great future of the poultry keeping industry does not lie here, but in the hard-headed, hard-handed toiler on the land—the farmer, the fruit grower, the artisan and the dwellers in cottages—and to assist these people in attempting to make poultry pay, I brought out the Orpington, whose great characteristic is to produce more eggs than, existing breed; and my purpose is to continue breeding them in this respect."

G. Bradshaw, Government Expert in Australia, in his report of 1903, says:

"That Cook's breed of Orpingtons justified his assertion about their laying qualities, those who have made importations from the Kent yards have frequently testified. However, there were other English Orpington specialists who are what are called showgoers. These people paid no attention to internal qualities of the fowls, show-pen excellencies being the chief consideration. Whether the hens laid 40 or 100 eggs a year was of the very slightest importance; the winning of the prizes and the selling, at big prices, of birds likely to win being the chief end."

It was Partington of England who first started the Black Orpington on its modern road as a show-pen fowl. Breeders since him have secured still greater development of feather, and their Cochinizized type has found its way to America as well as Australia. However, some Australian breeders have steadfastly held to the originator's vision of what a superior dual-purpose fowl should be in shape and performance, and it is the Australian poultry keepers who have the great record egg producers in the variety today. They made the most of the breed in a utilitarian sense and put it at the top as a layer. The Americans made the most of the breed as a show fowl and put it at the bottom as a producer of hen fruit. The show-goer got in his deadly work by breeding for great size, wonderful length of feather and abnormal deepness of body, resulting in almost invisible shanks. In other words he made a Cochinizized Orpington of the breed which owes its greatest productive qualities to the Langshan. Instead of the cobby, smooth feathered sturdily built dual-purpose fowl, we find a grand but loose feathered bird of mammoth size and beautiful color, the creation of the ultra-fancier or fad-dist in both England and America.

It was in the Feathered World, England, September 2, 1910, that illustrations of the "Evolution of English Types of Langshans, Cochins and Orpingtons" by the eminent artist, J. W. Ludlow appeared, from which we reprint the Orpington panel on this page. Mr. Ludlow's com-

By J. H. DREVENSTEDT

**Extremes and hobbies are harmful—Leave well enough alone—
The ideals of the originator—Not too small a comb on a big breed.**

ments on the progressive evolution of the Orpington are as follows:

"Look again at the middle row, 'Orpingtons' (7 to 12). Many fanciers objected to the scanty foot-feather of the Langshans. It was said to be neither one thing nor the other. So clean-legged strains were soon started, leading up to leggy No. 7, on the left, and finishing off with the up-to-date short legged ideal as depicted to the right (No. 12.)."

Black Orpingtons were first exhibited at the Boston Show in 1890, but it was not until William Cook appeared at Madison Square Garden, New York, in 1903, with a great string of English Orpingtons that the real Orpington boom got under way in the United States and Canada. It was at that show we first met the late Mr. Cook, and handled Orpingtons. The 1905 type depicted by Artist Ludlow in the sketch above was fairly well represented in the males of the Cook string, and from what the originator led us to believe, is the cobby, useful shape an Orpington should possess. However, the fancier thought otherwise, as the No. 12 sketch by Mr. Ludlow shows the favored type to be in England in 1910.

The accompanying illustration of a Black Orpington female, winner at New York, 1911, shows to what extent the massive full feathered English type was carried. Here is a large appearing bird with body set low and shanks barely visible, the type of female favored by fanciers of that time, and, by a few to the present day. Such females by their great size, due to loose feathering, and their usually fine beetle-green plumage, seemingly impress the fancier more than the shape and carriage required by the American Standard of Perfection. The males of the same strain as the hen referred to above, also were large appearing specimens with great wealth of long feathers on the saddle, short in leg and not as closely feathered as the Orpington males of earlier days.

A Change in Type.

During the past two years; breeders of Black Orpingtons have come back to the originator's ideal to a great extent, realizing that, if the Black Orpington is to retain a reasonable degree of popularity, it must possess the qualities demanded of a dual-purpose fowl today. In other words the Cochinizized Black Orpingtons must go and the original Orpington saved from degeneration in type and usefulness.

The tendency among some breeders has been to shorten the back, neck and legs, and to lengthen the feathers. At some of the shows these shortened birds with duck-like legs and Cochin fluff are the only ones that have had a chance of winning in the past. Exhibitors and judges have practically followed Standards of their own in respect to shape by allowed grossness of plumage to supersede smoothness with the result of a loss in symmetrical proportion of the various sections.

As much is being said and written about changing the wording of the Standard for Orpingtons, and the American White Orping- (Continued on page 813)

Changes in Orpington male type from the early Cook type to the full, rounded bird.

Good Type of House for Growing Chickens

THERE are a multitude of uses for well built small houses in connection with poultry keeping and practically every flock owner needs one or more.

The colony system of brooding with coal or oil stoves is indispensable where large numbers of chicks are raised if over-crowding and soil contamination are to be avoided. Brooder stoves are operated in all sorts of buildings but best results are secured when each stove is run in a separate colony house designed to furnish the right amount of floor space and the proper arrangement of light and ventilation.

Soil sanitation is so vitally important in raising strong, vigorous stock that every poultry keeper needs at least one small house that can be moved frequently for use as roosting quarters for the growing stock. On farms where a house full of young chickens is moved out into the cultivated fields much insect damage can be prevented to the growing crops by the bug catching activities of the chicks and the field will be enriched by the distribution of the droppings from the birds.

A movable small house for the growing stock can materially reduce the feed bill by furnishing a place where the chicks can pick up waste grains and insects after harvest, and such an arrangement furnishes ideal conditions for promoting good health in the young stock.

After pullets and cockerels begin to near sexual maturity, small houses are a great convenience in keeping the pullets away from the cockerels and from the old hens so that the pullets have a chance to develop normally. Where cockerels are being saved for breeding purposes much annoyance to the rest of the stock can be prevented by putting the cockerels in a movable house and locating it in the edge of the cornfield or some other desirable place at some distance from the headquarters of the other poultry.

Even during the winter months small movable houses very frequently come in handy for use in storing feed or as hospital quarters for sick fowls.

During the breeding season small houses frequently make it possible to establish special matings which could not be maintained if the houses were not available.

The house in which the brooder stove is operated during the spring months should be built so that it can function during the early summer as headquarters for the range flock; be used during the late summer as a special pullet house; during the winter function as a feed room or hospital, and then serve as headquarters for the breeding flock in the early spring before the brooding season starts. Thus year-round service can be gotten from the right type of small colony house.

Many suburban dwellers who live in rented property and are unwilling to go to the expense of building quarters for poultry on land which is not their own could indulge their hobby for chickens by erecting movable colony houses and taking them along when they move to the next place. It is entirely feasible to build small houses that are not only movable but that can be put together in sections so

By **T. S. TOWNSLEY**

A number of houses of this type are being erected by the Government at the Missouri College of Agriculture for the purpose of training disabled soldiers in poultry culture.

they are easily taken to pieces for long hauls.

In designing a small house to meet the needs which a properly designed colony house can fill, consideration should be given to the comfort of the house in both winter and summer, the ease with which it can be moved, its general appearance, and cost.

Due probably to the ease with which they can be built a majority of the small houses seen on poultry plants are of the shed roof type. While the shed roof colony house is fairly satisfactory if due attention is paid to light and ventilation, the gable roof type of construction appears to have many advantages for colony house building over the shed roof plan. The gable roof house is easier to move than the shed roof type on account of being better balanced, is more attractive because of its

finished appearance, gives an opportunity for windows on all sides, and affords more room for working inside than any other type of house. The gable roof house requires less lumber than a shed roof building of the same size and is no more expensive to build.

Size of Colony House

A colony house that may be used as quarters for the stove brooder during a part of the year ought to be large enough to furnish

room for exercise for 300 or 400 chicks but must not be so large that it cannot be readily moved. The most popular size of colony houses are 8 ft. wide and 10 ft. long, or 10 ft. wide and 12 ft. long. Larger sizes can be moved only with great difficulty and smaller sizes are not satisfactory for stove brooders.

Colony houses are usually rectangular instead of square because a house somewhat narrower than it is long can be more easily moved through gates than a square house having the same floor space. In the shed type houses the greater length is usually from east to west with the roof sloping to the north, while in the gable roof house the greater depth is usually from north to south with the roof sloping east and west. By having the greater depth from north to south the roosts can be placed farther away from the opening and the birds will be more comfortable on cold nights than where the short dimension is from north to south.

An 8x10 colony house is sufficiently large for the medium sized coal or oil stoves and will accommodate from 250 to 300 chicks. It is also large enough to furnish roosting quarters for 20 or 25 hens on a town lot.

The 10x12 colony house is sufficiently large for the larger stove brooders and furnishes sufficient floor space for 400 to 500 chicks. As a back lot house it will provide quarters for 30 to 40 hens.

Building Details

A small house that is to be moved must be of frame construction and cannot have a solid foundation or a concrete floor. For suburban properties small stationary poultry houses of very attractive design (Continued on page 818)

Putting up the frame for a 10x12 ft. gable roof colony house. For picture of the house complete see page 818.

The Growing Chickens

The fancier delights to get his young birds in his hands at this season of the year and examine them closely. If they have off-colored shanks, a side sprig, or stubs, they are marked for Sunday dinner.

Some of the early chick feathers are disappearing, and better colored ones are covering the body. Still more changes will take place, as the growing chickens shed old feathers and grow new ones. Each set will be firmer and better adapted to meet the needs of an enlarging body. Unless the fancier has watched the changes and development of plumage in his birds through several years, he should not be too quick to cull out off-colored birds.

When cockerels are in their chick plumage is a good time to size up their breeding possibilities. Some defects that appear in their first plumage will be lost later. If you want to pick a male that will breed good colored pullets, be sure that as a little cockerel, in his chick plumage, he was as near as possible what you would like to see in the way of good pullet color.

In going over the chickens and studying them, you will find many points of interest. The changes and improvements in the plumage of well bred birds offer a continuous source of interest. It is by watching this progressive development, ever keeping in mind the particular sire and dam of the birds under observation, that you learn breeding tendencies and acquire that fundamental knowledge of mating that comes from experience and cannot be acquired from any printed page.

It is a fatal mistake, from a breeding standpoint, to send off the early broods to market, simply because prices for early broilers are high. Keep some of the big, early cockerels. There is no rule of thumb by which to select the best ones. That knowledge comes gradually to those who are interested and observe their birds throughout the growing period for several years. Some advise picking out the fastest growers, those that are first to sprout their comb, crow early, and are most precocious. Pick these birds for breeding for several years, and you will lose size, for the precocious bird always reaches maturity sooner than the bird that spends more time growing bone and body.

This has been a good year for growing chickens. One breeder in Massachusetts, writing under date of July 9th, said that he had "birds as mature, if not more so, than specimens we have sent to the New York State Fair in September."

Chickens should grow well at this season. From the Minorcas through the Rocks, Reds, Wyandottes, Orpingtons, to the Brahmas, chicks should make two pounds in the first seventy days, and then make a pound a month to maturity. Better records are common, but every breeder should maintain the pound a month in the larger breeds, and unless he does so he should not be satisfied.

A great many flocks do not do well in the summer. The weather gets hot and dry, and the growing birds are too much confined. They also lack cool, fresh ground in the shade of bushes.

Undoubtedly the present system of housing growing chickens will eventually be improved to overcome close summer confinement in their roosting quarters. We live in a country of great variations in temperature. A difference of 108 degrees is not uncommon; from 18 below zero in December to 90 above zero in August. Our houses are a sort of compromise between these extremes in temperature, as if they were planned in winter and built in summer. For a growing chicken that has never seen winter, the sheds for growing stock are as a rule too tight.

Chickens are a species of birds. And birds, where do they roost? In the bough of a tree where the wind blows over

them, and under them and all around them, and the change in the air, from the dryness of the day to the moisture of the night, settles on them. They do not get down from their roost in the morning, languid, sluggish, inactive with ruffled or soiled plumage.

Almost all poultrymen keep their houses clean so the air will not become polluted, and they keep the windows open so the air will not become stale. By fresh air, they mean good air. But out-door air is more than that. First, it is cool. Second, it is moving air. Third, it is relatively moist air.

Hot air in a roosting house upsets circulation and the birds become dull and languid. Still air in a roosting house blankets the birds and produces a deadening effect. Lastly, the out-door air not only has more motion and is more moist, but it is more variable. Hospitals long ago quit maintaining a perfectly even temperature in their wards. They work their heating apparatuses so that the temperature varies considerably. Slight changes in temperature are stimulating and wholesome for the body.

This writer made a trip recently through Grundy County, Illinois, to visit a number of farm poultry keepers. F. E. Longmire, the county agent, had arranged a poultry tour. About a hundred farmers and farmer's wives made the tour. Anyone who drives through Grundy County will see more farm flocks of Buff Plymouth Rocks, and good flocks too, than he ever imagined existed. But that is beside the point. At noontime, the party drove into the park at Morris, Illinois, and had a picnic lunch. It was a fine day, a fine trip, good company, marred only by this writer's remark, when he said that "none of the growing chickens on the three farms visited this morning, are right."

Why were they not right? Too close confinement both in sheds and runs. Each of those farmers had brooder stoves, and the houses had been built for warmth in the early spring. In July those houses were playing havoc with the growing chickens. Some wise inventor will some day build a portable brooder house; one that is firmly braced with studding, from which you can lift whole square sections of the sides and front to let in the moving, moist, variable out-door air. In the meantime this writer will continue the experiment of summering his youngsters in big lilac bushes where they are bathed in air. Sometimes they are drenched in rain, but in the past three years in which we have followed this method of out-door roosting, we have not had a single cold. Last September we had a slight attack of chicken-pox, although in some other flocks it was quite severe. One neighbor recently remarked: "I like to come down to your place occasionally just to see how the cockerels and pullets do feather out!" From the reports of rain in New Hampshire, Connecticut and Ohio, this out-door roosting probably isn't to be recommended without qualification; but the need of more open growing sheds should be recommended most strongly.

The very idea of chickens looking languid with rough or fouled plumage, should be repulsive to the poultry keeper.

In the old days, the hen stole her nest, and hatched practically every egg, and grew a clutch of chicks as even as peas in a pod and as plump as quail. Today we go to a lot of expense to provide a lot of modern things for our crop of growing chickens. Too often the building and yarding program is overdone, with the result that a debilitated condition makes it impossible for the chickens to make full use of the feed they consume; they falter in their growth, get thin in the breast, and represent a loss rather than a profit.

The poultryman today should really get wonderful results. There are lice powders made especially for his benefit. If he employs more out-door roosting he need not concern himself about lice paint, for sunlight is a destroyer

of mites. He can purchase finely ground and well blended growing mash. He can set a barrel of semi-solid butter-milk in his barn to mix with water and mash, and feed once a day. The morning feed can be wheat, the evening meal cracked corn. The wet mash can be fed at noon. Feed liberally for your fresh-air chickens will eat heartily.

There are reports this year of intestinal, round worms afflicting some flocks; also there is some coccidiosis. Both of these troubles get into the ground and contaminate chickens that run on it. Both may begin to affect chickens from 6 to 10 weeks of age. The wormy bird may eat well enough and drink a great deal of water, yet not produce meat on its carcass or make growth. The bird affected with coccidiosis may be a poor eater, rather unable to digest what it eats.

The chickens that came out of the stolen nests in the old barn yard got along in good shape in those days. The species is just as strong now as it was then. To overcome trouble, start among the youngsters to select strong birds, and cull out those that show weakness now or at any later date. Do not say: "But she is so well bred, so fine in color." Insist on a chicken first. Then give more house room, more moving, out-door air, more fresh ground to the growing chickens. Disease and weakness are not things for you to fight and overcome. Have the conditions right and the natural resistance power of the birds themselves will fight and overcome disease and weakness.

Exhibitors Want a Record Card

A year ago, as we recall, a gentleman in the South showed a big, well grown Barred Rock cockerel at the Boston show. He had good Plymouth Rock type and was straight barred with a clean color. Some good judges of Plymouth Rocks thought the bird would get somewhere in the winnings. He did not. The judge at Boston, carrying out the New England judgment of what constitutes a good Rock,

held that the bird was a trifle leggy and lean, and was not of the closer knit, firmer type of Plymouth Rock that New Englanders grow with such success. Nobody criticised the judge. He was engaged for the purpose of making just such critical selection. That was his job as a judge of that class.

We happened along the Barred rock aisle and saw the cockerel. Dan Lambert and Arthur Hawkins were there. It wouldn't seem like the Boston show if these two old breeders were not to be seen together in front of the Barred Rock coops.

Mr. Lambert remarked: "There is a nice big bird that would appeal to some people. I have just looked up the catalog and find that he is shown by a southern breeder. It seems wrong that some little memo could not be made to tell the visitor in this aisle what the judge found wrong with this bird, the same brief statement to be sent to the breeder to advise him just what the judge thought of his bird."

Some will say: "Boston is a comparison show, and Mr. Lambert is a score card judge and everybody knows it. Why dig up the dead score card to kill off the success of the living?"

It is true that comparison judging gives the best satisfaction in big shows where competition is keen, but there is merit in the old score card system, and that merit lies in the fact that you give an exhibitor something to take home with him; you give him a card with the judge's signature at the bottom of it.

Mr. Lambert has worked out a record card that seems

to combine the merits of the comparison and score card systems. The birds are judged by the comparison method, but the judge fills out a little card that is tied to each coop, and that card goes to the exhibitor as a record of the judge's opinion of the bird in that coop. During the week of the show the cards hang on the coops, and visitors have access to them. If a fine bird is disqualified for a stub, the interested spectator instead of pass-

ing on in wonderment that such a superior specimen should not have a ribbon, may stop to read what the judge found in the bird.

Mr. Lambert sends us several of these record cards, which we reproduce on the preceding page, together with a recent letter from him as follows:

"While at the Boston Show last January I called your attention to a simplified score card or rather a card on which the judge could make memo. for his benefit and the instruction of the exhibitor. The idea was to provide the judge with a system for making the awards and to leave exhibitors the trail of his work.

"I will enclose four cards of the same number of imaginary birds with awards according to the checks and notations.

"Nearly every comparison judge, whom I have seen at work, checks up his opinions as he finds them, sometimes in a note book, more often on the coop card. Unless we know the method employed by that particular judge we are at sea as to his findings until the awards go up and sometimes moreso when they do as to why one bird was preferred by him over another and why others did not come in the race.

"With a card of this kind everything is open and above board. There is less chance for mistakes, such as marking up the wrong number in the book.

(Have known this to happen in two classes at one show and the judge called by wire to fix it up after returning home.) Also, the exhibitor has the judges written word on each bird shown.

"I do not pretend that this is a perfect system or that these cards should be universally adopted, but I do claim that for the good of the cause of poultry exhibitions there ought to be some method whereby the judge can leave to the exhibitor a few words why his birds were superior or on the other hand why inferior and did not win.

"Of course we are satisfied when our birds scoop all the best prizes and feel that we know what the judge thinks of them. But, when the boot is on the other foot how do we feel about it? We wonder if the class was handled properly, we try to guess which of ours, in the judge's opinion, were the best. We cannot know unless we ask him and of times his time is so much taken that we have to hang around half a day to get in our request and then wait his time.

"We need something of this kind and I hope the time is not far distant when I shall see it in use."

This is the time of year when show secretaries should be thinking about their forthcoming exhibitions, and making plans for the judging of those exhibitions. We know of no better plan for the average show than to adopt the comparison system of judging in conjunction with record cards for each bird. There is no copyright on Mr. Lambert's card. It can be printed by any printer at small cost. The size of the card is 3 inches wide by 6 inches long.

Judges will at once see that these tags can be made of service in providing a place to rate the merit of the bird, by means of "X" marks—a system followed by practically all judges when working in a comparison show. Moreover, the judge has the protection of leaving a record of the bird as he found it on a particular day, as each tag is dated.

The average exhibitor wants a record card of some kind.

The small breeder is the support of the poultry shows, just as he is the support of the specialty breed club and the poultry press. Each of these agencies should do all that they can for him. The big breeder who wins

the prizes can take care of himself. It is only good business to do something for the small breeder who is the basis of your support.

Look at the four cards in the illustrations, read the writing on them, and then think what a wonderful educational institution your show would be if such a tag, filled out by your judge, hung from the coop of each bird in your show.

A Utility Standard

The accompanying cartoon shows the utility poultry keeper loaded down with eggs, with the sweat dripping from his face, plodding along the country road to market, with no chance of catching a ride on the swiftly passing dolled-up Standard of Perfection. The cartoonist in explaining the situation says: "He needs a business car of his own," namely, a "Production Standard."

We believe that this cartoon represents a distorted view of the 1923 Standard which is pictured as a pleasure car going in the op-

"No room in the 1923 Standard for the utility man." The accompanying editorial on "A Utility Standard," explains the fallacy of this view.

posite direction. However, a great many people will agree with the cartoonist and say that he is absolutely right in depicting the Standardbred bird as a white-collar proposition that rides in an exclusive soft-cushioned limousine, with no room for the man in overalls.

In sending in this cartoon, Mr. Ashbrook, gifted artist and poultry keeper, wrote that perhaps we would not care to print the picture, since it varied somewhat from our attitude and was not altogether in line with our policy. We replied that American Poultry Journal was not a one-man paper, and that we would print the picture. In addition, we print the little note which Mr. Ashbrook wrote to accompany the illustration. It follows:

"The title of the cartoon is not a criticism of the occupant of the car, but an obvious fact. Pedestrian should not expect to catch a ride.

"It's a pleasure car and anyway it seems to be going in another direction.

"Pedestrian can afford to have a car of his own, of a model designed for his needs. He'll have to have it if he expects to get anywhere, for his business has grown to immense proportion.

"The man with the eggs is the real billion dollar poultry industry.

"The breeding of wonderful ideal fowls is no more an industry than are the creations of the artist or the composer. Is there an oil painting industry, or a classical music industry? We should shout not!

"The breeding of ideal fowls is the life work of master breeders and of other breeders who must borrow from the creative and constructive genius of the leaders.

"The utility breeder is a poultryman of

very different aim. He caters to the unappeased appetite of Uncle Sam. The utility breeder worthy of this designation produces flocks of breed-type, egg-type fowls—fowls of utility and beauty—as breeding stock for those whose desire it is to help feed hungry Uncle Sam.

"Standard and Utility breeders and poultrymen are not working along strictly parallel lines. Why, then, should their standards be bound under one cover, making a two-part book in two languages? Certainly not a great many poultrymen are sufficiently familiar with or appreciative of both languages to want such a book.

"Utility needs its Standard. It needs, too, to standardize that which is to go into it.

"After the Knoxville convention of the American Poultry Association has O. K.'d the wise decision of the Revision Committee to recommend that utility be denied admission to the Standard, then let utility get busy on its own book."

The fallacy of this argument lies in the fact that the Standard Committee does not recommend that utility shall be denied admission to the Standard of Perfection. What the committee does recommend is that the proposed chapter on production, which includes a description and illustration of ovaries in hens, and deals with such matters as feed and lice, together with the relation of molting and pigmentation to egg production—shall not be included in the same book with the Standard text that covers the technical Standard requirements of the breeds. Common business sense is on the side of the Standard Committee. The A. P. A. is hardly in position to finance the new Standard, let alone a lot of additional type matter and cuts on how to cull a flock.

The Standard deals with breed type and breed characteristics. It describes breeds that haven't much utility, such as Malays, and Exhibition Games, but those breeds are distinctive, are purebred and are therefore recognized as Standard breeds. When it comes to what are known as the great, modern, utility breeds, such as Brahmas, Langshans, Rocks, Reds, Orpingtons, and Leghorns, every feature that is known to bear on utility is taken into consideration in establishing their Standard shapes. As an illustration of how utility is considered: The Standard Committee did not recommend that the Orpington be given a forward dip to its breast, although some specialty breeders asked for that description, for the committee believed a crouching forward type would make the Orpington sluggish and of less utility value. The committee specified that Plymouth Rocks should have a rather broad feather in their back to get away from any tendency toward slow feathering and split wings. The committee accepted the recommendation of the Committee of Forty to increase the weights of Leghorns, so as to secure a bird of more size and substance; and the value of the comb of the Leghorns was decreased to allow an increased value being given to body shape.

Utility was not ignored, neither was it held in contempt and despised.

After receiving Mr. Ashbrook's cartoon and comment, we felt a little disappointed. We wondered what mysterious and undiscovered something there was that should be inserted in the Standard text of the breeds in order that the birds of those breeds might become better utility fowls. We wrote Mr. Ashbrook asking, "Are you really opposed to the present Standard bird? Are there any changes that you would make in the Standard to make the Standard bird a better utility bird? Personally, I fear a lot of this utility propaganda is destructive, rather than constructive."

He replied: "Answering your first query, 'Are you really opposed to the present Standard bird?' As I understand it, the query means, would I want another breed Standard for the utility class. Would answer emphatically NO. Would answer your second query with another emphatic NO."

There you have the situation, friends. When it comes right down to brass tacks, there isn't much to change.

It seems easy to say "Oh! those are only fancy chickens. I want utility." But when it comes to pointing out wherein the Standard-

bred bird is deficient, or how to improve its type, the problem isn't so easy.

Utility makes a fine flag to head a procession. Many people will fall in behind it, and the band will strike up. But when the parade is over, the fire works shot and the shouting quieted down, you will find the old clothes and the old job of breeding good Standardbred poultry waiting for you.

We do not maintain that the Standard is a perfect book. If it were perfect, it would be finished and no further revision would ever be necessary. We do not share with Theo. Hewes the opinion that the work of the present Standard Committee will stand for the next twenty-five years with but slight changes. Time will bring with it changes; there will be progress and the Standards for the breeds will be gradually improved as surely as knowledge increases.

We honestly believe that the next five years will see more handling of specimens in judging and that body conformation will become equally as important as that outline shape which is largely dependent upon plumage for its lines. The wise breeder is going to span his birds from side to hips to keel bone back of legs and breed a big barrel, and he is going to breed a back that neither decidedly rounds down nor sharply narrows in from hips to tail piece. There is nothing in the Standards of the popular utility breeds that will in anyway discourage these new practices, and their adoption by breeders in mating will speedily lead to their adoption in the Standard of the future.

One correspondent writes: "If that utility chapter fails to get through at Knoxville, where will the rejected manuscript go?" The culling proposition, and that is what the utility chapter is, has been pretty fully described in State Agricultural College bulletins and poultry journals. Practically all of the up-to-date material on the subject appears in the new, 1922 edition of Walter Hogan's book as revised by Thos. E. Quisenberry. In other words, the material as far as essential facts are concerned, is already in print and is already available.

Information on selecting late molters and hens with faded shanks, is widely distributed. Nearly everybody knows about big abdomens and thin pelvic bones. Professor Townsley writes that his article for the September issue of this Journal will describe and illustrate the details of this culling proposition. Professor Thompson has an article in this issue on the subject. There is no copyright on the information. It has been and is being published broadcast.

On the other hand, the Standard of Perfection is a valuable copyrighted book. It contains the official description of the breeds. It is the one sure source of income for the A. P. A. All the other ventures of the association have been failures or near failures. The text book, the market standard, the war poultry books, have been disappointments. The breed books up to date have been losers. About the only way to get another superfluous book in type is to bind it in conjunction with the Standard of Perfection.

A bigger and better and more important thing is to lay plans to put the Standard of Perfection into the hands of more people, especially beginners. The slogan should be, not to load down the Standard, but to put a Standard description of the breed into the hands of every new breeder. Keep the Standard as it is, an authoritative guide for judges and breeders, and then secure wider distribution for it.

When Harry Lamon made his new breed, the Lamonas, on the poultry plant of the U. S. Department of Agriculture, he was interested, from 1912, when he made his first crosses, to 1922, when he resigned as senior poultryman for the government,—he was interested primarily in breed type. Culling was a by-product of his operations, the same as feeding, housing and watering. Unless he had established yellow shanks as a breed character, pale shanks would not mean anything in culling.

The Standard in the future as in the past should deal with these fundamentals of breed character.

A profitable hatch at the Continental Hatcheries, Polo, Ill.

From Coast to Coast Best Chicks and Most!

Read these letters from two of the 800 successful hatcheries using Buckeye Mammoth Incubators—one from California, the other from New Jersey:

"Berkeley, Calif.

We have had our No. 8 Mammoth Incubator in operation since February of this year. We are well pleased with the results for this season. Business has been extra good with us. Hatches run from 60% to 78% of all eggs. The above difference in percentage is due to the different kinds of eggs that we were compelled to use. Results have been most satisfactory. As to the quality of the chicks, one customer bought 200 and in six weeks had not lost a chick. Another bought 350 and in six weeks had lost only three. So you can see that we are well satisfied with our No. 8.

CALIFORNIA HATCHERY
J. G. Tunncliffe"

"Vineland, N. J.

I took the first hatch out yesterday and am more than pleased with the success—76% for this time of the year is not only a good sign for the quality of the breeding stock, but also for the quality of the incubator. I am pretty sure that I will

be in the market for another No. 7 for next year, as I am going to sell my
Paul F. Smith"

* * * *

The Buckeye Mammoth is proving itself every week in the year, *the real business incubator* for the commercial hatchery business.

The Buckeye user knows in advance within one to five per cent just what his hatch will be. And he knows that Buckeye chicks have the *strength and vitality* that means less than half of one per cent loss in shipping. The Buckeye Mammoth occupies only about one-fourth the room and saves half your time and labor.

We will be glad to send our Buckeye Mammoth Catalog, which tells all about this remarkable invention. Let us show you how to start small and grow big in the commercial hatchery business.

Sheppard's Summer Sale Price List

This season has witnessed a great appreciation of "Famous" Anconas. This year Sheppard's "Famous" Anconas made the astonishing amateur egg laying records of 339 and 335 for 365 consecutive days. This INCREASED THE DEMAND FOR MY STOCK.

One of the biggest winnings I ever made at Madison Square, New York, last January (and all of my winnings for the past 15 years have been outstanding) BOOSTED MY SALES.

Sheppard's "Famous" Anconas are worth every penny of regular prices asked—and they are mighty big bargains at Summer special prices.

Are You "UP" on Anconas?

There is a saying that folks who aren't up on a thing are apt to be down on it. Get the facts about Anconas. Look over the evidence. Don't believe gossip either for or against. I have put all the facts and results secured from "Famous" Anconas into my 100 page catalog. If you haven't a copy, write for one. It's free. Don't guess about Anconas, KNOW. Then with the facts before you, decide whether or not you wish to purchase some "Famous" stock at present low Summer prices.

Size of Leghorns

Frank D. Rogers, Illinois, recently remarked that a 4½ pound Leghorn cockerel was a good sized bird and that he did not believe it advisable to add a half pound to the Standard weight. He further stated that he was as much opposed to the little Hamburg-type Leghorn as anybody, and would favor making the disqualifying weight one-half pound, so as to enforce Standard size in exhibition Leghorns by disqualifying specimens that fall more than a half point under the established Standard weight.

Mr. Roger's position is semi-official, as far as the White Leghorn variety is concerned, for he will be inaugurated the next president of the National S. C. White Leghorn Club.

Dr. L. E. Heasley, Michigan, another Leghorn breeder of long experience, takes the same position, and recently stated that after carefully studying the arguments on Leghorn weights he believed that "most of those favoring an increase in weights, do not argue for the need of a Leghorn larger than the present Standard calls for, but rather that the under-sized Leghorn be more severely penalized. It is my judgment," Dr. Heasley continued, "That we should not increase our present Standard weights, but that we should disqualify Leghorn females that fail to weigh within ½ lb. of Standard weight at the season when the weight clauses are in effect." Dr. Heasley does not include the little male, although he undoubtedly so intended. It is our judgment that the little, fine-bone male should also be hit on the head—and should get the ax first.

Again we repeat, we doubt very much if the majority of the membership of the American Poultry Association in convention assembled at Knoxville, will approve the proposition to increase the Standard size of the Leghorn, although it seems certain that the disqualification on under size will be made more stringent. However, if a word to the wise is sufficient, then let us suggest: If you want to get under the ribbons in the big shows, keep out of the pee-wee class; get some body on your birds. It is well enough to talk about the runt female being a great layer. How is she as a breeder?

Status of Things in England

We read a great deal about foreign affairs in the daily press but poultry is not mentioned. The following communication from Edward C. Ash, England, gives a rather intimate view of the status of poultry breeds and breeders in England. If the British Isles, with their millions of population, could be towed over and anchored outside of New York harbor, we might be more interested, but even with a span of three thousand miles of salt water between us, the reader may find items of interest in the following English notes:

"The poultry season in England has not been as successful as could have been wished, for the very cold winds during the spring had an adverse effect, both on the fertility of eggs and the vitality of the germs. The result has been that the hatching percentages have been below the average.

"Owing to the slump, the trade this year for purebred sittings suffered, the more so as the unemployment in the larger cities affected the buying powers of that large and powerful group of fanciers, the back yard poultry keeper. It is a well known fact that many of the finest birds in England have been bred in the cramped and close quarters to be found amongst the dwellers of the working classes in our large industrial towns.

"The serious unemployment has compelled these fanciers, the best buyers, now unable to afford outlays on stock, to wait until better times come again.

"The showing season has shown a slump in entries, for the small fancier has not been able to afford the outlay and expense of entering and sending the birds to the shows. The high rates charged by the railway companies put the lid on it altogether. Again, many of the larger poultry breeders have been hit by the lack of trade and have entered less birds in the shows than they would have done if circumstances had been different.

"But considering what the fancier has to face, the entries at most of the shows have been quite fair, and the quality of the birds turned out shows that the character and type and quality of stock has not deteriorated as much as would have been expected from the

war and financial conditions of the country; and what has been lost has just as quickly been recovered in most varieties.

"We can see clearly that certain breeds have forged ahead and left other breeds behind, some of which have dropped back and will soon fizzle out altogether unless great efforts are made. It is partly due perhaps to the fact that utility, or some utility at least, has become the main object of poultry keeping.

"Sooner or later, the economic question always exerts itself, for the cottager or town dweller having hens is not likely to be satisfied to be purchasing eggs whilst his neighbor has an ample supply of home produced commodities. Hence sooner or later the who who has a breed which does not lay is anxious to change that breed for something which does lay, unless of course, he is a fancier, pure and simple, and is so wrapped up in his and beauty of his birds that eggs take a very secondary place.

"The Favorelle, so popular a few years ago, appears to have vanished until quite recently when the club came to life again, and we saw for a few weeks every sign of a renaissance. But lately, and to judge from show schedules, and classes, this exceedingly fine breed is not making the headway which was anticipated. And I believe that if breeders eliminated the feathered legs, the Favorelle would become popular. The feathers on the legs, which get foul, kill the breed.

"The Spanish variety has also a waning tendency. An odd bird appears in an A. O. V. class now and again; again, here we have the result of developing monstrous characteristics until the bird has become ridiculous and painfully ugly.

"Even the White Wyandotte, which is still popular, has its popularity on the wane.

"The utility White Wyandotte is today a small bird, whilst the show White Wyandotte has become perhaps one of the most magnificent types of fowl imaginable. Birds of enormous size, of the purest white plumage, and of great width, are to be seen at the leading shows and in the leading yards, and hens of similar size are exhibited in White Wyandotte classes at classic shows. But they are not the egg laying type, and who can afford to keep monster fowls for appearances only?

"Lord Dewar, at the Chelmsford show on June 6th and 7th this year, showed perhaps the most magnificent White Wyandotte cock that has been seen for many a day, and although at the Essex Show it was not awarded the prize for the best bird in the show, in the opinion of many competent judges, there was not another bird under the canvas to equal it.

"Of course, this size development takes away from the egg-laying powers of the breed, and these huge show specimens of White Wyandottes, fine as they may be, do not contribute to the utility type, but gradually divide the breed into two varieties, the show type and the utility type, which appears from previous examples to be the first step in a breeds downfall.

"In Wyandottes, the Black Wyandotte is a very charming variety, and will, I believe, supplant the White Wyandotte amongst the utility breeders, before many days are past.

"Mr. Cunliffe Owen, at the Chelmsford Show, showed a Black Wyandotte rock, pitch black to the skin, and a hen of exceptional color, which went as far as to try and prove her utility by laying an egg each day during the show, as well as laying one in the basket on her way to the exhibition.

"These Black Wyandottes are exceptionally good layers and their color allows them to stand the dirt conditions which appertain to town poultry keeping. And their vigor and fascinating appearance, combined with the egg-laying powers, makes the Black Wyandotte a breed well worth considering, a breed which will become very popular indeed, especially for those whose space is limited.

"The position in England of the White Leghorn is very similar to that of the White Wyandotte.

"The show White Leghorn is a very large bird indeed, and is no longer a layer, whilst the laying type, one of the finest egg machines in the world, has become so weakened in constitution by egg development, and has also lost so much of its type, that the lack of stamina amongst the British White Leghorns is complained of on all sides. Many of the heavy laying Leghorns are very, very small today and the combs are often upright, and the bird has lost that curious Leghorn type which for so long was so well marked.

"In the Blue Leghorn and the Brown Leghorn, the utility type is still an excellent proposition.

"At the Chelmsford Show a very fine Brown Leghorn cock, the property of Mr. Cunliffe Owen of Loughborough, won first prize. It was an interesting bird, for it

White Leghorns

Write today and let us tell you about our "Stylish" cockerels, beautiful pullets, wonderful cocks and showy hens that will win top places at the show where you want to win. Learn what Oak Dale can do for you.

They have the glossy finish, full length of feather—already to win regardless of competition.. Single individuals or a full show string.

We also have hundreds of beautiful utility pullets that will pay their way by laying in early fall and winter. Winter eggs command the high prices. We still have a few bargains in one and two year old hens from our Hoganized High Egg Producing Flock.

Oak Dale Leghorns are the large kind

You want quality and egg production combined for your money. Oak Dale has both.

Read what our customers say:

Mr. Harry M. Lamon,
Oak Dale Farms,
Le Roy, Minn., U. S. A.

Dear Sir:

Birds arrived today in A lcondition. The way they hopped out of their crates, so full of vim and go, after a journey of approximately 1500 miles during this hot weather, was ample evidence of their state of health.

The striking resemblance that those birds bear to one another, makes one wish he could only see your whole flock. They certainly bear the earmarks of scientific breeding. The value of such birds for a beginner in building up a flock can hardly be estimated in dollars and cents. I wish to thank you heartily for the excellent value you have given me, and the care used in selecting males and to overcome defects in my own flock.

I am, Sir, yours for a continued business,

Respectfully yours,

JOHN H. DAVIS,
Per A. D.

Breeding Birds at Reduced Prices

THE OPPORTUNITY to improve your stock at a saving in price is here. I offer at this time a limited number of choice breeders to make room for growing stock. Males and females bred from the same pens as my Champion Boston Cockerel and other winners at Boston and Madison Square Garden. A hen from this line of winners laid 201 eggs in 12 months at Storrs, Conn., and then won 8th at Boston in a class of 43. These birds will be worth double the price next season. The records made year after year by my Rhode Island Reds prove that they are superior to any other. Send in your order early.

FUNK EGG FARM Lyle W. Funk, sole owner, Box 38 **BLOOMINGTON, ILL.**

showed the old fashioned Leghorn type to a nicety and had the wonderful rich coloring which Brown Leghorns carry. It was an out and out winner, far ahead of any other bird in the class.

"The Blue Leghorn Club, seeing what has happened to the white variety, is careful to retain type, and hence they still carry the Leghorn characteristics and the stamina, badly needed if heavy egg production is to be continued. But in Blues there is room for color improvement; they are not blue enough.

"Forging ahead to an extraordinary extent, not only the numbers kept, not only in the keenness and interest exhibited by the general public, but also in improvements of the birds themselves, we find the Campines.

"A little over a year ago there were only some 16 members of the Campine Club; today there are over 200 members. A little over a year ago, at the classic shows, there might be an entry of a few Campines, an odd Campine. Today, at the classic shows, entries of Campines make large classes, and even at the smaller shows, Campines turn up in considerable numbers.

"It will interest breeders of this variety overseas to know that the Golden Campine in tail barring and also in body barring has for some reason or other forged far ahead of the Silver Campines, and also that the green sheen type in Silvers which is so prominently developed in America has gradually come to be in England too. A comparison of the plumage of the present day American and present day English Campine, will show a surprising similarity between the American and British bird of today.

"Another two breeds which are forging ahead are the Black and Blue Orpingtons, and the most magnificent specimens of both these varieties are being exhibited, birds of great size, typical shape and wonderful coloring.

"The Buff Orpington has, however, lost its popularity and I very much doubt if it will ever regain it over here. But the Blue and Black are taking the place of the Buff, and whilst breeders can turn out birds of the size, shape and color, which the leading black and blue breeders are doing today, there is little doubt that the prospects for both these Orpington varieties are very bright indeed.

"Barred Plymouth Rocks are still great favorites. Golden Barred Rocks and Buff Rocks and White Rocks have their followers; but none of these more or less new varieties have made much headway, whilst the old Plymouth Rock still takes the lead, and holds the lead, too.

"Of all breeds here today, the Rhode Island Reds are perhaps the favorite, and the improvement in color and shape during the last few years has been phenomenal.

"Birds are red right down to the skin, and even in the darkest specimens the black marks and smut which for so long regularly appeared, has been eliminated. Classes for Rhode Island Reds practically at every show are the largest classes at the show, and competition is so keen and the bird so good that to get in the money in the Rhode Island Red classes today means a great deal, a very great deal.

"Light Sussex are also great favorites; and magnificent birds with plenty of feather and purest white plumage with a hackle feather perfect in detail, appear constantly in the show pens. A deep black hackle and white body feathers free from dark undercolor has come.

"The Speckled Sussex variety has been greatly improved recently; the rich color of their plumage is richer than ever, and green and bronze and deep reds have been developed. The beauty of the variety would easily place it amongst the leading breeds of the country if it were not for the inferior eggs this breed nearly always lays.

"The Red Sussex and Brown Sussex varieties show little movement, but there is, however, little doubt that the Red Sussex will sooner or later hold the position it deserves. For the good Red Sussex is a magnificent bird, but the Rhode Island Red has taken its place more or less.

"Minorca breeders on your side of the water will regret to learn that over here owing to the over development of the earlobe and excessive comb, that the breed is no longer the bird it used to be. Their size has been increased and the development of face characteristics has resulted in a reduction in egg producing powers and taken away with it from this variety many of its supporters.

"Once upon a time the utility breed, today it is taking a back place, and it no longer commands the interest or support. It is a great pity, for the Minorca was one of the finest laying breeds we had.

CANDEE

Front and Back Rows of Eggs on each tray automatically turned just the same as the inside rows

THE Candee Perfected Automatic Turner meets every requirement, turning every egg—whether trays are full or partly full—and it solves the problem of how to turn the front and back rows of eggs just as much as the inside rows. One master lever turns every egg needing turning, in any capacity up to 10,200 eggs.

Supplied in Either Single or Double Decks

Each is a Complete Machine—no need to transfer eggs from upper to lower decks. Upper deck has hatching trays, and nursery under trays exactly the same as the lower deck.

All Candees Truly Sectional—They are shipped all built, ready to set on their legs. Any handy man can set it up in a few hours

Patented Heat Control—Each 300-egg compartment has its own automatic water regulator that prevents surplus heat from entering the egg chamber.

How Candees Stand Up—Read this letter from one of the thousands of satisfied Candee users:

DELAMERE POULTRY FARM

Stratford, Ont., Can., June 23, 1922.

"Gentlemen: It might interest you to know that for the past season, just about to close, I have averaged 78% hatches in my Candee. I am now contemplating installing another of your mammoths to take care of my rapidly increasing business. The original machine, as you know, has just completed its 11th season, and is still practically as good as new. It has given eleven years of perfect satisfaction.

Thos. G. Delamere."

CURRENT NOTES AND COMMENT

Cold Storage Holding

When Summer egg prices get low producers often think of the commission house man who has a cold storage plant back of him. On this subject, Emmett E. Houser, Iowa, writes: "I wish you would tell me where I could put my eggs in cold storage until this Fall or Winter."

"Am getting lots of them and don't want to sell when they are so cheap. Do you know anything about the charges for storage?"

There are dozens of cold storage warehouses in every city and these houses rent space. The renters do not all get rich. Some go broke. However, the details in connection with refrigeration are interesting, and we are pleased to present the following summary, as supplied by E. F. Murphy, head of the egg marketing work for the Illinois Agricultural Association:

"Referring to your letter of March 14th with which you enclose a letter from Emmett E. Houser, Iowa, that asks for information on the storage of eggs, I wish to give you the following data based on present conditions:

"Eggs were bought for storage this Spring at about \$7.00 per case, or approximately 23c a dozen.

"The cost of storage is 12c per case for the first month and 6c a case for each additional month. One should carry insurance on the eggs and this will vary in accordance with the kind of a house they are stored in. A good house here in Chicago, I find, has an insurance rate of \$4.00 per year on \$3,000, or, in other words, it would cost about 1/2c per case for six months insurance.

"It is customary for the storage firm to make arrangements for the person who is storing the eggs to secure for him an advance of money on the eggs. This year, they are contemplating an advance of \$5.60 to \$5.75 per case, if the eggs are stored which are purchased at \$7.00 a case.

"If eggs are stored in car lots there is no cartage charge, inasmuch as the car is put on the track at the storage plant. If the shipments come in in less than car lots or in small lots, the cartage charge is 4c per case to the storage house.

"Your inquirer will understand, of course, that there are 30 dozen eggs per case.

"The interest charged on money advanced is 7 per cent.

"The total cost per dozen, then, of storing eggs in less than car lots, for a period of six months, would be a little less than 1 1/2c a dozen. This figure includes cartage, insurance, cost of storage space and interest on the money advanced for a period of six months. If eggs are stored in car lots, the cost is slightly less, as explained above.

"Of course, the person storing eggs will pay the transportation charges to the city in which the eggs are stored.

"The letter which you sent me indicates that the writer desires to store in small quantities at different intervals. I would suggest that if this is the case, small express shipments be sent into the storage warehouse and, after the storage warehouse has accumulated 100 cases, then they can make out the note for the advance of 80 per cent of the value of the eggs and other additional papers.

"I should like to caution the inquirer that it is very important that the eggs be stored in a storage house that has the reputation of keeping proper temperature, ventilation, etc.

"It is also important that the dirties, checks and cracks be taken out and only the strictly fresh eggs be put in storage."

* * *

Ash Cans

We have had about the same trouble with rats and mice that you have had, and used about the same remedies with about the same success.

The other day we decided to build a feed bin to hold a hundred pounds of cracked corn,

a hundred of wheat and a hundred of growing mash. In figuring up the lumber and galvanized iron that was to cover the lumber, the cost amounted to \$10.

The thought struck us: Why not use ash cans? They are made of galvanized iron with metal covers. Because the cans could be set in the barn, out of the rain and sun, the cheapest sort would answer the purpose. The department store man priced them at \$1.45 each, delivered. They work.

The clerk who sold us the cans remarked: "We sell a good many for that purpose. Yesterday I shipped 24, \$2.50 ones, with ribs down their sides, to a poultry keeper out of the city. I guess he wanted to put a feed can in each of his colony houses."

* * *

Mr. Rolf Misunderstood

Few young men in the poultry industry deserve more credit than Arthur F. Rolf, savior of the National White Leghorn Club. Mr. Rolf is earnest, fairminded, progressive. He plays above board.

Last month Mr. Rolf sent an announcement to the poultry papers regarding a federation of specialty clubs. This might be interpreted as a move to form an association of breeders to succeed the A. P. A. The fact of the matter is, Mr. Rolf wants to help the A. P. A. by more closely affiliating the specialty clubs with the old association.

In some quarters, however, an evil intention was attached to his letter of announcement, and it was headed in one poultry paper, "Et Tu Brutus." Translated from the Latin to English, that means "And thou also, Brutus."

It was Caesar who uttered that expression. Brutus was his friend. The Roman senate had conspired to murder Caesar. Caesar enters the senate chamber, and the fateful act is performed. With blood flowing from his side, and tears from his eyes, Caesar turns around and sees his friend, Brutus, among the assassins. His last words are: "And thou also, Brutus—then I fall."

A. F. Rolf has already been dubbed "Brother Rolf," and now he becomes "Friend Brutus," who would destroy the life of the A. P. A. Could a more villainous significance be attached to Mr. Rolf's motives?

Such intellectual shafts, intended to pierce the heart of good men, are as unnecessary as they are unkind. They breed hatred.

* * *

Finances

The talk of writing a new constitution for the A. P. A., and reorganizing the association, receives the attention of conservative members because of the financial situation of the association.

Life memberships have been sold and the money has been spent, but the membership must be carried. This is a burden.

Who voted away the money? There is only one answer: The members themselves in convention assembled.

It is true that wind-jammers and barnstormers helped the thing along—but the responsibility rests with those who cast their votes.

What is to be done? Each life member can hold the A. P. A. liable for a life membership. Each member in actual fact, is a member for life. The association offered those terms and the members accepted them. That makes a contract between the member and the association. It is a valid and honorable contract.

An equally honorable contract was signed by Germany. She agreed to pay certain reparations to the allies. France, England and Germany agreed to the amount. Uncle Sam approved. But time is showing that Germany cannot pay, and it is ruinous to make her pay. The contract stands; it was entered into in good faith, but its terms are proving to be impossible.

Nearly everyone knows the story of Antonio, the merchant of Venice. His ships were at sea, and he needed a little quick money to help a friend. He went to a money lender and put up a bond that called for a pound of his own flesh, to guarantee the loan. When the loan fell due, Antonio, with his ships lost at sea, was unable to pay it, and then the money-lender asked for his pound of flesh in accordance with the terms of the contract.

Through Molting Quickly— LAYING AGAIN!

Big Egg Records and Big Profits are made by the hens that take few vacations. Globe Egg Mash contains everything needed for growing new feathers. Keep it before them all the time and they will molt evenly and as quick as nature will let them. Some hens, when fed Globe Egg Mash, lay right through their molt.

DICKINSON'S GLOBE EGG MASH

should be supplemented with Globe Scratch, fed in a deep litter, to induce exercise and furnish fats and carbohydrates. All live dealers sell Dickinson's Globe Poultry Feeds or will procure them on request.

WINAMAC, IND.

Cull Out Loafer Hens

Don't Kill the Layer. Market the Culls and Save Feed.

Nearly 50 per cent of the hens in every flock do not lay a sufficient number of eggs to pay for the cost of their feed alone. Nearly 50 per cent of the male birds in every flock are not worth breeding from. Therefore, one-half of the poultry owned by the average poultryman consumes the profit that he makes on the other half of his flock.

The most important thing that should be known by every poultryman is to tell how to select his good layers, how to cull out his non-producers, how to pick the birds that consume feed but do not lay, and how to pick the birds that should be held over as breeders.

During the next few weeks is the important time to cull out the loafer hens. Hens that

Keep This Hen-

have ceased to lay eggs should be disposed of at once. By culling out these hens now you will not only save feed, but you will get a higher market price for the culled out hens. The longer you keep these hens, the lower the price will be on the market.

Cull them out and sell them as soon as they cease egg production. Keep the hens that lay late in the summer and into the fall months. It is easy and simple to tell these hens if you have the plain methods and secrets outlined in the new book, "Dollars and Sense in the Poultry Business," written by one of the World's leading poultry experts, Prof. T. E. Quisenberry. Outlines full information on How to Tell Poor Layers; How to Save Feed; How to Get Big Egg Yields; How to Build Simple Houses; How to Remodel Old Houses; How to Prevent Sickness and Disease, and hundreds of other money-making secrets and ideas. This book is free if you write at once for your copy. Don't Delay. Write to American Poultry School, Dept. 2062, Kansas City, Mo.

Eggs All Year Round Pay- We Show You How To Get Them

Our new book "For Better Poultry" gives simple feeding directions which if followed will make your hens more healthy and vigorous and increase their egg production. This is especially true if you feed Surene Buttermilk Egg Mash. This feed, rich in "vitamines," develops vigor and vitality in hens, enabling them to maintain a super-egg production all year round. Right now you should put your pullets on

SURENE

Buttermilk Egg Mash

It will develop them rapidly to early laying maturity and give you twice the egg production that you can get from ordinary grain feed. If you cannot buy Surene Buttermilk Egg Mash from your dealer, write us. Do not accept any "just as good" substitute for Surene.

Get This New Poultry Book

FREE 64 pages of accurate information and advice on best breeds, houses, incubation, brooding, diseases and how to avoid them; how to feed hens to keep in best condition and sustain heavy egg production; how to feed and raise most chicks from every hatch. Written by a prominent poultry expert. Write for it today. Sent free postpaid. Give the name of your feed dealer.

American Milling Co.,
Dept. 1 Peoria, Ill.

Did he get it? No. Instead, the very name of Shylock is hissed down through the corridor of time.

Contracts should be entered into cautiously. They are not easily broken. But, there come times, as in the case of Germany, or in the case of Antonio, that they were better broken.

The A. P. A. finds itself face to face with the serious obligation to carry for life the memberships of nine thousand members, with the membership fees already spent. We do not ask that the A. P. A. repudiate its contract, but suggest that members be receptive to any suggestion that is well intended to alleviate the burden.

* * *

Light and Dark Barred Rocks

Chas. Morgan, Illinois, who wrote an article for the June issue of the Journal advocating two varieties of Barred Rocks, writes us again as follows:

"Since writing you the last time I have been giving this Dark and Light matter considerable study and have about arrived at the conclusion that Barred Rocks should be shown as per Standard requirements as near as possible, though I doubt very much indeed if we will ever reach the point where the male and female that match in shade of color will be produced from the same mating. Neither do I think we have any reason to feel that we should expect to produce our best birds in that way. After listening to breeders discuss the desirable features of males and females of some of the other varieties, I find they are virtually compelled to resort to practically the same methods, i. e. double mating, though they do not come out in the open and admit it as is the case with us fellows, who, I believe, in most cases are asking only for a square deal for our favorites, 'The Grand Old Breed.'

"At this time I really feel that the Light male and Dark female, while both are today bred to a point of great merit, should be entitled to a place in the show room or Standard no more than are the non-Standard birds used in producing the Standard or exhibition specimens of other breeds. If every sort of breeding bird in all breeds is to be accorded recognition what a gathering we would have and what a time the judges and breeders would have. In my opinion such matters should be taken care of by breed clubs in the literature pertaining to their respective breeds."

Mr. Morgan has bred Barred Rocks for twenty years, and he was "taken off his feet" apparently, by the glamor of the two variety program, but it appears that upon more mature consideration he sees that confusion worse confounded would result from standardizing two varieties of Barred Plymouth Rocks. If this subject can lay over a year so breeders can think on it, there will be not half as much enthusiasm for two varieties.

* * *

Registration

The question of pedigreeing and registering poultry is a subject that will not down. Although the American Standardbred Poultry Registry Association undertook this work and gave it up, it is possible that they were only ahead of the times. We acknowledge with appreciation the following impressive letter on the subject from L. J. Brosemer:

"I am more and more impressed with the fact that the record-of-performance-work fostered by the Canadian government is a step forward!

"Think: during the past fifty years draft-horse breeders have bred more power into trotters, more milk into Holsteins, cheaper meat into beef cattle, finer wool on sheep, more pounds with less feed into hogs. What have poultry men been doing?

"Sitting over here with the best interests of the poultry industry at heart, but fortunately far enough away so that one can look at it from a distance which enables him to see its form and texture, these thoughts occur to me:

"The A. P. A. can do nothing without money.

"It is the only national livestock association on this continent which attempts to operate on the revenue obtained from members, and a few minor items.

"The A. P. A. can best obtain the money it needs to do worth while things (year after

KIRCHNER'S BETTERBILT SECTIONAL BUILDINGS

Poultry Houses Hog Houses and Garages

These are the strongest, most durable and attractive buildings made. No extras to buy. We furnish everything complete ready to set up and bolt together. Easy to take down and move. Cost less than to buy lumber and build. Send for free catalog.

year, through money derived from the registration and transfer of pedigreed Standardbred fowls. The horse, cattle, hog, sheep, goat, dog, cat and rabbit industries have registry associations. Why can't the A. P. A. have a registry association?

When you buy what is known as standardbred chicken, what do you get?—Nothing but so many pounds of flesh and blood.

"When you buy what is known as other Standardbred animals, what do you get?—So many pounds of flesh and blood, and a record of its ancestry. And this is most important, vitally important, because the animal you buy is merely an omnibus in which its ancestors ride. And nothing can be transmitted that is not inherited!

"The world is making too much progress not to have something like this happen within the ranks of the A. P. A. before many years. We don't ride in ox carts any more, nor do we cut grain with a scythe. There is nothing radical about it. There are just as many honest men in the poultry industry as in any other industry. So long as the A. P. A. keeps in the rut it is now in, it will always be 'the chicken business.' Why don't some of you fellows who are some day going to have the whole load on your own shoulders start to make your stand now? Of course you are going to have to fight! Nothing worth while in this world was ever done without a big scrap!"

* * *

Showalter Goes to Kansas City

Few men in the poultry business have a wider personal acquaintance among poultry men than Harry R. Showalter. Mr. Showalter has accepted a position with the Keiper Cooping Co., as western manager, and will again be on the show circuit this Winter.

* * *

Discrimination Against Leghorns

Thos. F. Rigg has addressed a letter to the market editors of produce journals and leading daily papers that quote produce prices, asking for a change in the market term of "Leghorns." Mr. Rigg's letter was as follows:

"About two years ago the term 'Leghorns' came into use in poultry quotations in pricing undersized hens and broilers. The term is a misnomer and an injustice to the breeders of Leghorns, of which there are more in the United States than of any other breed.

"Some of the leading produce men have agreed that the term 'unders' would be more appropriate as properly describing this grade of fowls. Since the term 'Leghorn' is already in use it will be largely up to you and your fellow market editors to right this wrong by properly editing your market quotations and inserting the term 'unders' instead of 'Leghorns.'

"For your information I might state that there are a number of breeds of poultry as light or lighter in weight than Leghorns and that there are many strains of Leghorns which weigh as much as the so-called heavy breeds.

"As an act of justice to the rank and file of your farm and suburban subscribers, all of whom raise poultry, and on behalf of the members of the American Poultry Association, who breed Leghorns, I appeal to you to see to it that the term 'Unders' is used in your quotations from now on."

* * *

New Heads of Agricultural Colleges

Poultrymen should note with somewhat more than routine interest, the appointment of heads of state agricultural colleges, which institutions are directing such extensive propaganda, and exerting such wide influence through the state organizations of extension workers and county agents.

It is encouraging when breeders are put at the head of these colleges, especially breeders who have a sane conception of poultry.

Professor Herbert W. Mumford of the Department of Animal Husbandry, Illinois College of Agriculture, was recently appointed as dean of the College of Agriculture and director of the Experiment Station and State Extension Service. Professor Mumford has been head of the animal husbandry department at the University for twenty years, having built up the department from the beginning to its present high standing. He has also directed the investigational work along livestock

Green Sheen Strain Silver Campines

I HAVE 400 Campine chicks, the oldest about five months. They are the biggest bodied, best maturing lot I have ever had. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

Queensbury Farms Pullets and Yearlings

Queensbury famous S. C. White Leghorn free range pullets from the same blood lines as our great contest birds are now ready for shipment at various ages or to be reserved for later shipment. The real American money making hustlers that you've heard so much about. Prices at rock bottom now.

Yearling hens selected from our own winter layers offered for August at special summer prices. Now is the time to order before the best ones are sold.

Queensbury Farms 123 No. Main St. Toms River, N. J.

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICECIL." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Licecil vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54 Quincy, Illinois.

lines in the department, the results of which have placed the department among the foremost of the country.

Professor Mumford has a wide reputation as a breeder of purebred swine and beef cattle and enjoys the confidence of the livestock fraternity of this country.

He will assume his duties September first, upon the retirement of Dean Eugene Davenport, who has occupied the position for the past twenty-eight years.

Last August Professor W. C. Coffey was inaugurated as dean of the Minnesota College of Agriculture. Dean Coffey is known throughout purebred circles as a sheep breeder. The product of his mind and vision as a livestock breeder is shown in the development of the flocks of sheep at the University of Illinois. With a small outlay of funds but with a keen perception of merit in breeding animals, he developed flocks which won in the foremost shows of this country and some of his top animals commanded the highest prices that were paid at leading sales.

* * *

Poultry and Egg Tariff

Although protection is a strict canon of Republican faith, a number of the schedules in the tariff bill may be finally reduced by Congressmen who can see two sides to a proposition. There is one schedule, however, on which there should be little doubt as to what is the right policy for the American law makers to pursue. That schedule has to do particularly with protection on dried and frozen eggs from the Orient. American poultry farmers and farmer's wives cannot compete with the Chinese.

John L. Childs of Pekin, China, at the recent international bible student conference, said:

"While American influence is now greater than it ever has been in China because of the work done by the missionary agencies, the introduction of the factory system by Americans and the requirements that employees work from twelve to fourteen hours a day without proper sanitary conditions is giving the thoughtful Chinese much to criticize. Christian principles must be applied to industrial life in China and in this country if we are to make the progress we ought to in China."

Mr. Childs read a statement contained in a report of an industrial concern doing business in China in which the stockholders were told that "it will be seen that the company is in an exceptionally favorable position. With the raw product at its doors, an abundant and absurdly cheap labor supply to draw on and no vexatious factory laws to observe, it is not surprising that its annual profits should have exceeded its total capital on at least three occasions."

American firms are largely engaged in buying Chinese eggs, employing Chinese labor to manufacture them into commercial products, and exporting those products to the United States. Whether you are a Republican protectionist or a Democratic free-trader, you are a poultryman and you know that protection against an agricultural Orient is different than protection against France, England, or even Germany with her depreciated mark. You will therefore be interested in the report that on July 10 the U. S. Senate voted tariff duties on eggs as follows: Eggs in shell, 8 cents a dozen; frozen eggs, 6 cents a pound; dried eggs, 18 cents a pound.

Prof. Jas. E. Rice, Cornell University, who has been most active in representing poultry producers in the matter of tariff schedules, before Congressional committees, states that, in his opinion, a tariff that would be protective of American producers should call for a duty of 8c a dozen on eggs in shell, 8c a lb. on frozen eggs, and 24c a lb. on dried eggs.

Importers maintain that such a schedule would prohibit imports. It appears, however, that egg breaking establishments in the United States will not begin operation with an 18c duty on dried eggs. That leaves the field open for Chinese exploitation.

In parts of China a man may be hired for \$8 a year, American gold, and \$4 a year extra for clothes, etc., making the labor cost \$1 a month. Upon the eggs reaching Seattle, a car can be shipped to New York for \$144 less than Washington state producers pay to ship a car to New York. Eggs by way of Panama Canal can be put down in New York

Solves Dry-Mash Feeding Problem

The Cymaco Dry Mash Feeder

pays for itself in feed saved as well as increased egg production. Made entirely of steel, weatherproof, stands on its own legs, free of ground. Agitator rod, worked automatically by feeding of hens, keeps feed from clogging. Adjustable by thumb screws for different kind of feed. Accommodates double row of hens. 2 ft. feeding space— $\frac{1}{2}$ bu. capacity, \$2.25. 4 ft. feeding space—1 bu. capacity, \$3.25. You cannot afford to miss this bargain.

Increase the Egg Yield

Because the Ideal Sanitary Fountain keeps water at the right temperature in zero or the hottest weather, it conserves the health of the hens and greatly increases the egg yield.

The Ideal is made of galvanized iron and built to last a lifetime. See your dealer. Write us for complete information. **Rockford Poultry Supply Co.** Lock Box JH 201 Rockford, Illinois

for about 15c a doz. It costs 27c to 30c to produce eggs in New Jersey. In 1920, about 70,000,000 dozens were imported from China, or their equivalent in frozen or dried eggs. All eggs in China are breaking stock, because eggs are cheap and wages cheap.

Eastern senators and representatives favor tariffs on eastern industry, but are not enthusiastic about the activities of the agricultural bloc, which insists on equal protection for the west and south. The east prefers cheap food and low wages for industrial workers. With this natural eastern objection in congress, together with the lobbying of big bakers, confectionary men and importers, it will not only be difficult to increase the egg schedules, but may be difficult to hold what the senate committee has granted.

The Washington offices of the National Grange, the American Farm Bureau Federation, the Dairyman's League, and the Southern Tariff Association are looking out for the interests of poultry producers. Poultrymen are contributing liberally to help along the work of the Tariff Committee. Everyone interested in the industry should read Professor Rice's article on the subject in this issue. Those who have not contributed to support the committee in its fight for protection on American eggs, should get in touch with Lyle Funk, treasurer, Bloomington, Ill. And wire or write your senator or representative, calling his attention to the fact that as a poultryman, and a constituent whom he represents, you ask for full protection against the Chinese egg. Tell him that this does not mean high priced eggs in the United States, because the price of eggs follows the price of grain, which is never less than 60 per cent of the cost of eggs.

Blue Andalusians

It has been said that "the Standard Committee made a new breed of the Blue Andalusian." The new description of color calls for a cleaner blue ground; in fact, so much cleaner that it was thought best to leave the Blue Orpington and Blue Plymouth Rock descriptions as they were, rather than to try to make these new varieties measure up to the Blue Andalusian color description. The type of the Andalusian was materially changed, to call for a bird high in shoulders, declining to tail; narrower in front of tail; and the female is to be free of concave cushion to tail.

On the advisability of accepting these changes, Walter C. Dobe, New York writes: "I have read and most carefully considered the proposed changes in the Andalusian Standard as recommended by the Standard Revision Committee.

"The suggested changes in color should have the tendency to lighten up the ground color and place a more distinctive lacing on the feather. We want the Andalusian to have a clear blue ground color that will smartly show up the lacing. In the past our Andalusians have had too dark a ground color with heavy lacing which did not show up a few feet away. This is something we must get away from to preserve the future popularity of this breed.

"I am particularly pleased to note the change in back to 'rather' long and body to 'long.' I have observed that the longer the body the heavier the layer. Andalusians lay an unusually large egg and naturally I believe the body change to 'long' is a very favorable one. The upright carriage and gamelike appearance should not be overlooked, as this has been characteristic of the Andalusians ever since they originated.

"Thanking you for your earnest efforts in behalf of our favorite breed, and with kindest personal regards, believe me to be,

"Walter C. Dobe."

Dr. Kent in New Position

Dr. O. B. Kent, formerly instructor in the Poultry Department, Cornell University, has accepted the position of director of the Poultry Service Department of the Quaker Oats Company.

Dr. Kent is a progressive young man, having served as President of American Association of Instructors and Investigators, and is familiar with the science and most modern practice of present-day successful poultrymen.

HALL

Nearly 20% More Chicks from the Famous Hall Mechanical Turner Egg Tray

The reason is simple. Eggs in the Hall Mechanical Turner Egg Trays are held in nature's position—large ends up.

This correct position of the eggs—large ends up—brings the head of the growing embryo at the large end of the egg, where the air cell should and will form if the large end is kept inclined upward. Results—larger hatches and better chicks.

Much of Hall superiority is due to eliminating the dead level position of eggs found in the ordinary mechanical turner egg trays—eggs resting flat or even worse, big ends down—standing the growing embryo on its head—resulting in large numbers of "dead in the shell."

The Hall Mechanical Egg Turner Tray most successfully imitates the mother hen—and beats her at her job. For while she instinctively correctly positions and turns most of her eggs, the Hall tray correctly positions and positively turns every egg at every turning, resulting in a big improvement in hatching performance over the usual haphazard positioning and turning of eggs.

During a career of more than twenty-five years Hall experts have produced all the elements upon which the profitable production of poultry and eggs now depend.

Poultrymen will be interested in our catalog explaining in detail many exclusive Hall features that increase profits. Send today for your copy and become familiar with Hall original and practical ideas.

Hall prestige backed by a substantial guarantee is your security.

The Hall Mammoth Incubator Co.

Originators of Coal-Heated Incubators and Coal-Heated Colony Brooders

180 Southern Avenue, Little Falls, New York

Increased Hatch Because of Increased Turnings

Mr. F. M. Prescott, Riverdale, N. J., on May 5, 1922, writes:

"After two months trial of the Hall automatic egg turners we give them unqualified success.

Let alone being a big time saver, they are a still bigger success in that they hatch out ten to eighteen per cent more chicks from the same eggs than by the old style trays. To us the larger and better hatch is a bigger item than the time saved in turning eggs and the extra chicks hatched out in one or two settings of the machine will in themselves pay for the cost of installing the automatic egg turners and after the automatic egg turners have themselves paid for their cost in three to six weeks, all the extra chicks hatched out after that for years to come and the big item of time saved in egg turning is all pure velvet.

We unhesitatingly recommend to every Hall user to install these labor saving and extra money making devices.

We make above testimonial voluntarily and are very glad to do so.

Position of Eggs the Secret

Mr. John Alden, Curtis Corner, Me., on June 3rd, 1922, writes:

"After giving the new turner a good trial, I find that I get 18 to 25 per cent more chicks.

"I am sure that the better hatches are caused by the position of the eggs, the big end a little higher at all times. I find that the chick forms and pips in the large end of the egg when using the new turners, to a large extent doing away with death in the shell at hatching time. In fact on one hatch I hatched every fertile egg on one of the turner trays. On this hatch alone the turners more than paid for themselves as I got 33 more chicks from this compartment that I did from any compartment using the old trays.

I shall place an order with you for turner trays before another season as I would not try to hatch without them."

Wipe Out Every Rat and Mouse

Amazing Discovery Quickly Kills Them All. Not a Poison.

Rats, Mice, Gophers,—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. The original time-tested Danyz, fluid true Virus. Entirely harmless to humans, poultry, stock, pets etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside, hunting air and water. Imperial Virus is put up in sealed bottles, guaranteed to retain full strength and potency. Only safe and sanitary method to overcome these pests. Endorsed by more than 60,000 users, including Farm Bureau Experts, and numerous factories and large, nationally known institutions.

LICE and MITE REMEDY FREE

Send no money,—just your name and address to Imperial Laboratories, Dept. 8049, Kansas City, Mo., and they will send you a regular \$1.00 (double strength) bottle of Imperial Virus, and will also include, free of charge, a full-sized \$1.00 bottle of Imperial Lice and Mite Remedy, enough for average flock. Pay the postman only \$1.00 and a few cents postage when the package containing the \$2.00 worth of remedies arrives.

Poultry raisers can easily and quickly clean out Lice and Mites by means of Imperial Lice and Mite Remedy. Occasionally put a few drops of this remarkable remedy in the fowl's drinking water. It renders all Poultry, including Hens and Chicks, immune and free from all blood-sucking parasites. It is also a splendid Tonic and Blood Purifier, and increases egg production. Positively guaranteed not to affect meat or eggs.

NOTE—Readers risk no money in accepting the above offer, as the Imperial Laboratories are fully responsible and, on your request, will refund your \$1.00 anytime within 30 days, if you are not entirely satisfied with the results obtained from either remedy.—Advertisement.

When to Cull and How to Cull

(Continued from page 789)

ing to the condition of the egg production being secured.

It is August, the very heart of the culling season. In the next few days throughout the country poultrymen will be invading their poultry flocks in search for loafers, boarders, and other criminal hens, bundling them off to the butcher who will bid the highest for the meat on their carcasses. Better the price of fowls in summer than spending the good money on feed that will never be transformed into eggs.

How should a poultry keeper judge his hens, in this process of culling? Again, opinions may differ. But there are certain signs that have been observed to mark the productive hens and brand the slackers.

Probably the first sign to look for is that which is most obvious, namely, the return of yellow pigment to those body parts, such as beak, earlobes, shanks, and vent, as hens stop egg production. It is a fairly accurately established point that in those fowls which normally have yellow pigment in the parts named and in the skin, the pigment disappears as the fowls become heavy producers, and reappears as that function stops. After the hen has stopped egg production for a couple of weeks yellow coloration returns to the region of the vent. Then, in turn, to the beak, the earlobes, and the shanks. Therefore, in summer, when a fully yellowed fowl appears it is reasonably safe to assume that she has not laid for some time. The pigment test is a good guide for the culling of the earlier season, but should not be relied upon without consulting other signs.

Good hens do not molt early in the season, if they have been cared for and managed under normal conditions. Poor hens are early molters. This rule is not infallible, but it helps. In August molters are not highly respected. True, of course, some excellent hens lay right on through the molt, but they are the exceptions that prove the rule.

Examine the lay-bones, or pelvic bones. In the hen that has stopped laying these bones have commenced to lose their softness and thickness, becoming relatively hard and less plastic, and the distance between them narrowing considerably.

Estimate the size of the hen. Rarely should a little hen be kept, that is little for her breed and type. It takes a hen with robust constitution and vigorous development to make a high record of egg production.

Handle the hens. Those with close, tight skins should be eliminated. The soft, velvety skin will be found on the hen still on the job.

Look over the head parts. The condition of the blood stream is a fair index of what is going on within the body of the bird. When the blood stream is full and vigorous the hen is probably laying. As the laying function ceases, the diminished blood stream is indicated by a shrunken comb, and the loss of the brilliant red coloration. The loafer usually shows a somewhat shrunken comb, pale color, long narrow comb points, and otherwise unbusinesslike looking head parts.

Eliminate any sickly or unhealthy looking specimen. A long season of heavy production may spoil some good birds. This cannot be helped.

The end of the culling story should not be reached until later fall, or in other words the process of culling can well be practiced until such time as only reliable and really profitable America great changes could be wrought this time as only reliable and really profitable fowls remain. If culling could be applied systematically and regularly to the flocks of America great changes could be wrought this very year.

I bring this article to a close by again emphasizing that culling is a legitimate, worthy, and business-like practice for every poultry raiser to use. Its place in the plan of flock development should be carefully studied and fixed. Do not make it try to do something in the development of the flocks that it never was meant to do. Use it in its proper place. Culling is one of the greatest improvements in modern poultry keeping.

Egg Shippers Doing Well.

Eggs marketed by co-operative egg and poultry shipping associations of Illinois are now bringing from one to one and a half cents above the top Chicago prices. This figure has gradually been raised on account of the growing demand for eggs sold by the co-operative associations.

Another feature of the business done by the central Illinois egg and poultry co-operatives is that the associations are gradually coming out on top in the light being waged against them in some instances by local dealers.—Illinois Agricultural Association.

Turkeys as a Profitable Source of Income.

(Continued from page 790)

old strong enough they should be allowed out for exercise, depending on the weather and surroundings. They should not be allowed to roam through wet grass, and should be brought home to roost each night that they might be cooped against all vermin and protected from rains. I have some small turkey bells that I sometimes put on the hens that persist in trying to hide out with their broods, and thus they can be located in the under-brush and weeds. We are careful to move the coops to fresh ground often, as the turkeys must have sanitary surroundings if they are to thrive.

As they get older we like to provide feeds that grow feathers and promote development of sturdy frames, such as ground oats, or scalded or soaked oats (fed sweet and before they sour), cracked wheat, maize, and as they near maturity whole grain in the fall. In localities where pecans and acorns, etc., grow on their ranging grounds they eat quantities of these which help very materially in the fattening process and impart a good flavor to the flesh.

There are a few points on which we can not lay too much stress if we are to attain the most success possible in our turkey raising ventures. They must be kept warm and dry while young, yet not too closely confined. They must not be over-fed, but fed often—a little at a time. And they must be kept free from vermin.

When we take a little downy poult weighing only two ounces or so and, by care and attention raise him up to be a strong, sturdy bird that will tip the scales at around thirty pounds before a year old, or maybe to near fifty pounds at maturity, and perhaps win the coveted prize in competition, and thus gain some note as a breeder, we are very much gratified and feel that we have accomplished something well worth while. By advertising and strictly honorable dealing, with the right kind of stock to back it up, we may build up a business that will soon be calling for more stock than we can supply, or if we prefer to sell on the market, by raising the better class of stock we can make it well worth while. Those nice turkey checks are, indeed, very welcome, especially around holiday times.

Standard Quality in Partridge Wyandottes

(Continued from page 791)

not too dark to set off the black penciling. "Deep bay" is one color but "deep reddish bay" means a tone of lustrous red added to it. The beginner will like these birds that approach more closely to the Mitchell color. Although not knowing it back in 1916 and not knowing it until American Poultry Journal gave Mr. Mitchell the public fame he so well deserved, I had his taste and can only wish that I had more good sides in common with him!

The Standard Committee recommends allowing a little red on the sides of the body, below the breast, in the males. There is a danger of this going too far. A few breeders of females (by what really is a double mating) have allowed red on sides of the male's body to develop to the point where it is not tinged, but the black body is splashed with red.

What the Dark Brahma men ask for should not concern us very much outside of the fact, that we must take interest in their breed to get interest in ours returned. Let them have white in lower body, and white in breast for that matter. It is true that their color type is the same, but in actual practice the white in silver penciled varieties is not as strong a color to work with as the red which takes its place in the golden penciled or Partridge varieties. When I bred Silver Penciled Wyandottes I used a much-splashed male to get strong penciling in my pullets, and I got it. At a large fair in Virginia in 1914, I won best female in the American class on a Silver Penciled Wyandotte pullet, bred from a male that had every feather in breast and lower body splashed with white. But in breeding Partridge color, the blacker the breast on the male, from a single mating, (and the male bred from a well penciled hen), the more distinct the penciling will be in the breast of his pullets. Males much splashed with red in breast always with me, breed more or less mossy breasts on their pullets. I like a male just splashed enough to be picked clean for a judge who wants a solid breast; this without making

him the least flat. So I like to see the breast solid or as near solid black as possible.

You see from my experience I can clearly say that white and red breeds of the same color pattern do not breed the same, perhaps depending on the different strength or make up of the colors that are combined in them. So is the fact, for I have found it, not from one mating but from a long line of matings through many generations.

The Under Color

There have been breeders of Partridge varieties in the past who demand a dark slate undercolor. Judges fostered such undercolor and buyers insisted on it. In fact, dark undercolor became an idolatrous obsession that worked injury to more than one splendid variety. Take the Black Leghorn and the Black Wyandotte. We demanded a yellow leg with a more or less black undercolor, and I remember the time when a neck or saddle feather with white next to the skin was considered a great defect. That the color pigment in the bird was not within sufficient control to make all the undercolor black and at the same time put pure yellow shanks on the male was never taken into consideration. With the undercolor "slate" in these two varieties and the "slate" defined as Mr. Platt explained it in the June issue of the American Poultry Journal on page 671, these two varieties would not only be much more popular; but the breeders of Partridge varieties, where slate undercolor is also required, will also benefit, for when anything short of white is rightly called slate undercolor, the time will not be far off when leg color in females of the Partridge varieties will change from "yellow or dusky yellow" to straight yellow.

The Male's Stripe

To the editor of the American Poultry Journal, I should like to say this (and for the good of all fair thinking and forward-looking fanciers I hope you do not blue-pencil these lines): I have more respect for your solid, thorough knowledge than ever, since I read your thoughts about the red quill in males. For several years, Mrs. Kreidler of Kansas City was in touch with E. O. Thiem, one of the originators of the Partridge Wyandottes. She not only knew him through correspondence but talked with him personally many times in the quest for Partridge-color-knowledge, and she finally bought out his flock. He stated to her (I found out after Mrs. Kreidler noted that I practiced the same method), that he would not use in his breeding pens a male with a solid black stripe, that is, all stripes in both sections of neck and saddle solid black. He even went far enough to call it "open lacing" but was afraid to demand such a Standard for fear that this point would be overdone. I agree. As it now is, an even colored male with solid stripes is the show male in most cases; the male with slightly accentuated wingbows and penciled stripes is the pullet breeder. That is a fake, an artificial condition. The dark pullet in the show room is another nature fake) if single mating is the sound policy, and I maintain it is the only way to build enduring popularity for a breed.

Give us more men who will not play to the petty caprices of theoretical authorities, but like Geo. W. Mitchell, Frank Platt and J. H. Drevenstedt, tell the truth about the tones and qualities of colors in color-breeding. Then we will see the varieties forge forward. There will be fewer if any inconsistencies between judging and mating. There will be few points that are inexplicable to the beginner who applies a fresh mind to the variety and is unable to reason out why prejudices for arbitrary requirements should be encouraged.

The Partridge Wyandotte will not be hard to breed when we get a female to match, at home and in the show. It would not be hard to breed and understand if we would permit both a solid stripe in the male and a stripe with red quill; a solid black breast and lower body, also one marked a little with red. Build your Standard on these lines and watch the Partridge Wyandottes boom!

A Record for Eggs.

On the 21st of last March, I had a White Leghorn hen lay an egg that weighed 10½ oz., and that measured nine inches in circumference, and eleven inches the long way around. What do you think of that for an egg, I have had the egg exhibited in store windows in Wellsville and East Liverpool, Ohio.

Need of Well Balanced Type in Orpingtons.

(Continued from page 792)

ten Club has submitted changes in type, which apparently are not in accord with the views of the Standard Revision Committee, we believe it opportune to call the attention of breeders of all varieties of Orpingtons to what happened to the Black variety when fanciers overstepped the Standard line and practically made a breed type of their own. A close inspection of the three leading varieties of Orpingtons, Buffs, Black and Whites—will recall the fact of the Black Orpington exhibits for greater uniformity in size and shape than either the Whites or Buffs. This is no doubt due to the Blacks being the older and original breed, but the skill of the fancier also must be given due credit for bringing about such remarkable uniformity in shape and color, even if he has molded a fashionable type of his own.

In looking over a choice lot of Black, White and Buff Orpingtons at a breeder's yard this spring we were impressed by the uniform shape and size of the Black males and females. They certainly had what can truly be said to be "breed type," even if it departed from the recognized Standard ideal. Among the Whites and Buffs the types varied among the males considerably albeit the choicer specimens approximated the Standard Shape ideal far more closely than the Black cocks and cockerels do.

Hens and pullets of the White Orpingtons ran very close to Standard form, in fact, we could not see where any change in the Standard shape sections could improve the bodily formation of these females. They have the frame, the size, smooth plumage and

The extreme full feathered type of Orpington that is an exaggeration on the Standard bird. The above hen was shown at New York, 1911.

sufficient length of shank when in normal condition. The length and breadth of back was all there and would balance nicely with other well developed sections unless the birds are over conditioned or too fat and heavy to show at their best.

It is the tendency toward heavy appearing, large sized specimens among breeders and exhibitors which, in our opinion, will work against the best interests of the White Orpington. The American Standard of Perfection says of Orpingtons:

"They are stately in appearance, with rather long, round deep bodies, full breasts, and broad backs; abundance of hackle and saddle feathers on the male giving the appearance of a rather short back; legs rather short and well apart."

That "abundance of hackle and saddle" and "legs rather short" are two points which breeders of Black Orpingtons evidently worked to the limit with the result of compromising the usefulness of the variety.

The stately White Orpington male is in evidence at our shows, in fact, the winners at most of the prominent shows are running quite true to Standard form as a rule; few loose feathered Creepers being found among them. If judges stick to the Standard type of the Orpington male it occurs to us, no change in the illustration will be necessary, even if the powers that be believe a more refined word description will help the breeder, exhibitor and judge to properly size up a breeding and exhibition cock or cockerel.

Typical illustrations succeed where word descriptions often fail in impressing the breeder

It won't be our fault if you don't have a

NEWTOWN

Incubator for use next season

We have told you repeatedly that if you want to be sure of getting a NEWTOWN—"the incubator that hatches the most chicks, the best chicks, with least labor and at lowest cost"—for use next spring, your order should be placed early. This is the last call. If you don't act mighty soon you will simply have to wait another year, because we can accept only a few more orders for delivery before the hatching season opens.

Year by year we increase our output of NEWTOWNS, but the demand increases even faster. And this tremendous demand is not created artificially. *It is the result of the real merit of this unrivalled chick-producing equipment.* The NEWTOWN stands supreme among incubators, not because of what we say about it, but because of what the machine itself does. Not because of the results of one season in a small territory, but because it has for years given 100% satisfaction to leading poultrymen in all parts of America and many foreign countries.

Order the time-tested NEWTOWN and have no regrets. And—*final warning*—order it *now* if you want yours for the 1923 season.

Write us the approximate capacity of the incubator you need and we will promptly supply all the facts.

NEWTOWN GIANT INCUBATOR CORPORATION

and judge of what a real Orpington male should be in the flesh.

As an instance, let us look at the Comb and wattles of the male illustrated in the Standard. They seem to fit the rest of the sections forming as a whole, a deep bodied but symmetrical bird of approved masculine type. The word description of the comb reads "rather large" which causes Wm. J. Hobbs to suggest that the comb of the male bird should read to correspond with that of the female, namely "Comb, medium size, set firmly on head." He also advocates that the wattles should be described the same as for females in the present Standard "rather small, well rounded at lowed edges." Mr. Hobbs is noted as a breeder and judge of Buff Orpingtons. Mr. R. F. Loney, breeder of White Orpingtons, also suggests that the comb of the male should be smaller pointing out as one of the difficulties in the breed, the excessive size of combs seen at times on good birds. Mr. Loney further contends that "one of the claims we make for the breed is their ability to withstand cold. Excessive combs do not go with this."

J. Alfred Hannah, secretary of the Black Orpington Club in the May American White Orpington Club Bulletin, which also publishes the views of Mr. Hobbs and Mr. Loney,

An idealized portrait of the White Orpington cock sold by Owen Farms to Aldrich Poultry Farm some 10 years ago, for one thousand dollars. This cock bird was admitted to be one of the whitest plumed as well as the best in type, size and bone produced up to that time. Several old fanciers of Orpingtons consider the portrait of this bird almost ideal in shape and comb characteristics, in fact superior to the present Standard illustration.—J. H. D.

expresses the opinion that "A long comb looks good and usually denotes plenty of 'pep' and vigor, and that's what we are after."

Large coarse combs are obviously undesirable, but we hazard the opinion that small combs and short wattles will also be found undesirable in a large breed such as the Orpington. The danger lies in the words "small" or "smaller," "short" or "shorter." An effeminate comb on a male or a masculine one on a female, are hardly calculated to make up a symmetrical whole of all the shape sections of an Orpington male or female, to say nothing of the "stately" appearance of either.

The normal comb of the Orpington male is neither small or very large, even if some of the over fed and highly conditioned, penned up, exhibition males are often topped with coarse and overly large combs. The English Standard calls for a comb of medium size, which is a good safeguard in England, for fanciers abroad have a strong liking for "heavy topped" birds. The American Standard calls for a "rather large" comb. This no doubt would possibly fit English Orpingtons and suit their breeders and exhibitors. Word descriptions are bound to be interpreted differently by breeders, exhibitors and judges, and the happy medium is always hard to find. As an old admirer of the Black Orpington fowl, we believe Secretary Hannah's words, "A large comb looks good and usually denotes plenty of 'pep' and vigor, and that's what we are after" clearly define what a really fitting and useful head piece should be, if the claims made by the Originator are to be fully sustained by the modern Orpington as a dual purpose fowl.

It is not our province to go behind the returns and criticise the work of the Standard Revision Committee in regard to the

changes made in the Orpington standard. Neither are we alarmed over the difference existing between the Committee and the American White Orpington Club over submitted and rejected changes. A few months deliberation over proposed changes may serve to bring the opposing factions in closer accord especially after breeders of other varieties of Orpingtons have been heard from.

It should not be overlooked that fanciers often have hobbies and ride them for all they are worth. In demanding changes in one or more sections to meet their individual preferences, they fail to take into consideration the possible adverse effect such may have on the general make-up of the fowl as well as on its stamina or vigor.

The standard fowl of today and of the future, at least the one belonging to any of the popular market breeds, must not only have fine feathers and type, but possess normal productive qualities. Standards for such breeds should be made to fit the normal breeding male and female, and not the abnormal "dolled up" exhibition specimens.

That in our opinion, is about the most important and serious work before a Standard Revision Committee and the American Poultry Association. The Orpington has made decided progress under the present standard and as one of America's noted fanciers remarked to us recently: "The Standard is alright if we follow it. Let well enough alone."

The Tariff Situation

By Jas. E. Rice

The poultrymen have won recognition and have secured substantial increases in the tariff rates in the Fordney-McCumber bill now before congress, but these gains may be reduced or lost before the final vote is taken.

The net gains of the McCumber senate bill on the existing Underwood-Simmons law, are as follows:

Eggs in the shell from free list (no duty) to 8c per dozen. A gain of 8 cents.

Frozen or liquid whole eggs, from 2c to 6c per lb. A gain of 4c.

Frozen or liquid-egg yolk 10 per cent advalorem (about 2½c per lb.), to 6c per lb. A gain of 3½ cents.

Frozen or liquid egg albumen from 1c to 6c. A gain of 5c per lb.

Dried whole eggs 10c to 18c per lb. A gain of 8c per lb.

Dried egg yolks, 10 per cent advalorem (about 2½c per lb.) to 18c. A gain of 15½c per lb.

Dried egg albumen 3c to 18c. A gain of 15c per lb.

While these gains look large, when calculated on a percentage basis of increase, they are not large when compared with what they have been and are now in the wholly inadequate tariff law which was made by the importers before the farmers had any voice in the framing of tariff laws for the nation,—a time when the farmers were obliged, as they are now, to pay tariff duties on the things they buy, while producing cheap food which must compete with the products produced by cheap labor of other countries.

The rate which the poultrymen seek to secure in the Fordney-McCumber bill are no higher, in fact are not as high, relative to the cost of production, as most of the products of industrial manufacture, which as a matter of wise policy have been and are now protected. The farmers and poultrymen are merely asking and are insisting upon receiving equal protection against cheap foreign labor in the production of the products of the soil, which in every sense of the word are manufactured products and cannot be considered merely raw materials. The poultryman is as distinctly a manufacturer of eggs and poultry as the man who manufactures shoes. He deals with precisely the same economic factors, capital, labor, machinery and raw material; his raw material being the elements of the air and the soil. As the manufacturer of food he is entitled to and must receive full protection.

The net result of the hearings before the ways and means committee of the house and the finance committee of the senate, and of the many conferences which have been held with special groups, and with individual senators and congressmen, and with all of the leading agricultural organizations having representatives in Washington, and with several members of the United States Tariff Commission, Interstate Commerce Commission, Department of Agriculture, and others, by a considerable number of the members of our Poultry Committee, together with the efforts of the poultry and agricultural press and of the thousands of letters and telegrams from individual poultrymen and poultrywomen, has resulted in a material increase in the rates now incorporated in the Fordney-McCumber bill as compared to the Underwood-Sim-

MILLER'S IDEAL Mammoth Incubators

Novins Poultry Farm
Toms River, N. J.

J. W. Miller Co.,
Rockford, Ill.
Dear Sirs:

It gives me great pleasure in letting you know that my first hatch in your Ideal Mammoth Incubator has been a wonderful success. The average percentage of the hatch was 73% and the chicks are nice, healthy chicks.

While hatching I showed my neighbor poultry men the Ideal Mammoth. I am also convincing the farmers to put in one and the way they talk, they like the machine very much; I think and am quite sure that I will be able to sell a few machines for you next spring, and would like to have you give me the agency in this territory.

Very truly yours,

NOVIN'S POULTRY
FARM,
B. Novins

The Results of a Lifetime—By J. W. Miller

Into Miller's Ideal Mammoth Incubator has gone the accumulated experience of a lifetime in building good incubators. Every detail of construction, each new improvement, represents the utmost in Mammoth incubator building. New in design; new in time and labor saving features; new in economy devices; new in greater dependability.

Leading poultry men say it is the best they have ever seen and worked with. Read Mr. Novin's letter to the left.

Improved scientific heat distribution, dependable heat ventilation, moisture equipment, safe and convenient turning of

eggs, unit form of construction—these are features of my new incubator that put certainty into hatches and guarantee you greater profits. With such features it is only natural that Miller's Mammoth Incubator should produce strong, fluffy chicks at the lowest cost ever known.

You cannot afford to be without a dependable incubator. Let me tell you my offer on shipping you one of these machines. The difference in the extra profits it can help you make this year is too great for you to overlook. Write today.

Special discount to early buyers. If in a hurry wire.

J. W. MILLER CO., Box '2, Rockford, Ill.

mons bill which is now in force. These increases, however, are not adequate. They are 2c per lb. lower on frozen eggs and 6c per lb. lower on dried eggs and egg products than the irreducible minimum, compromise rate which was finally recommended by the Poultry Committee to the Senate Finance Committee, namely: 8c per lb. on frozen and 24c per lb. on dried eggs and egg products.

Notwithstanding the material increases which have been secured in the Fordney-McCumber bills, our fight for a just tariff on poultry and eggs, and on other agricultural products, has not been won. We have merely taken the first two lines of trenches. The McCumber senate bill has yet to run the gauntlet of possible amendment before it is passed, and the rates may be materially reduced from those now incorporated in the McCumber bill, or may be increased from the rates now in the Fordney bill, by the Committee of the Conferees to which the bill must be referred for final agreement before it is presented to the two houses of congress for final passage. The Committee of Conferees usually includes the three ranking members of the Ways and Means Committee of the house and the three ranking members of the Finance Committee of the senate. If these members should be appointed, the Committee of Conferees would consist of the following congressmen:

Joseph W. Fordney of Michigan, Wm. R. Green of Iowa, Nicholas Longworth of Ohio.

From the senate:

Porter J. McCumber of North Dakota, Reed Smoot of Utah, Robert M. La Follette of Wisconsin.

Upon the final decision of these six men, assuming that they are the ones who will eventually be appointed when the bill passes the senate, will depend the poultry and egg rates which are eventually passed by congress.

Farmers and farmers' wives and poultrymen and poultrywomen in all of the states of the Union should immediately urge their representatives in congress, both in the senate and in the house to maintain the rate of 8c on shell eggs, and to increase the rate on frozen eggs and egg products from 6c to 8c, and the rate on dried eggs and egg products from 18c to 24c. Appeals should also be made from all of the states to the six members who presumably will be members of the Committee of Conferees as stated above. If the poultrymen and poultrywomen of the nation will do their part we are likely to win. We have the assurance of the absolute backing of the leading agricultural organizations and the moral support of a majority in congress. We can secure the active support of a majority favorable to our rates if the members of congress are made to understand that the rates which we seek are just and for the best interests of the nation, and that they can count upon our enthusiastic endorsement of their action if they support the rates which we seek to secure.

Our opposition is strong. The importers are waging the most aggressive fight which has occurred in the campaign in order to reduce the rates in the senate bill to those which are now in the house bill, or failing in that, to secure a compromise between the rates in the two bills. We must fight in order to win. We must succeed in securing our rates if we are to make it worth while for American capital to engage in the freezing and drying of eggs in this country instead of having American capital invested in China to secure the advantages of cheap eggs and cheap Chinese labor to manufacture the products to be sold in America.

The question of the tariff on poultry and egg products may be summarized by the American people asking themselves whether or not they prefer to have 70,000,000 dozen of eggs, or more, imported into this country from China and other countries in order that a few large importers, wholesale bakers and confectioners may be able to monopolize the frozen and dried egg industry to the exclusion of the American producer, freezer, dryer and distributor of poultry and eggs and egg products. A true American will stand four-square in favor of the protection of the American poultry industry when he properly understands the situation. Will you do your part to help to make the producer and the consumer and the manufacturer understand the real situation and our justification for demanding the rates which we have recommended?

What One Hen Did

"Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."

This is not a poetical discussion, but a very practical record made by Gloria, a S. C. Rhode Island Red hen.

year we had only ten ordinary hens. Then in the Spring of nineteen twenty, we bought some purebred Rhode Island Red chicks.

That Fall we had 27 fine pullets that began laying about Thanksgiving time. We were so interested in them, as more of them began to lay, that we thought we should like to trapnest them.

Unfortunately, we did not get this idea soon enough. For we did not begin trapnesting until the 6th of January, 1922. And then we met with some surprises.

Some of our finest looking pullets were not laying. Up to the middle of February five of the very largest ones had not laid an egg. So we decided that these must go for meat. This left us with 22 in our pen, 17 of which completed their records for the year.

Right from the start there were some outstandingly good layers. And soon we discovered that one pullet was outstripping all the others. Accordingly, we saved all her eggs during the hatching season. As nearly as I remember, we set about 60 of her eggs. But I have a record of the fact that of these eggs there were 43 chicks hatched, of which we raised 34. This hen's eggs not only hatched well, but her chicks possessed wonderful vitality and grew up to be excellently colored birds. Sixteen of them were pullets and 18 cockerels.

As the months passed we could see more clearly that we had a very unusual hen. She kept laying steadily on, with no impairment of her wonderful constitutional vigor. She never went broody during the year. In fact she has never been broody to date.

From January 6, 1921, to January 6, 1922, this Gloria hen laid in trapnest 264 eggs. I feel certain that she would have had a larger record if we had begun our trapnesting in November, when the first pullets began laying. She must have laid well during December, for she was laying every day when we began trapnesting. And the following December, when she started to moult, finished out her year's record. However, her record as it stands, of 264 eggs, we feel is very creditable for a Rhode Island Red.

Following is Gloria's record by months:

January, 21; February, 24; March, 29; April, 30; May, 29; June, 23; July, 25; August, 20; September, 21; October, 14; November, 16; December, 12.

Now let us figure the profit made by this one hen. We used 60 of her 264 eggs for hatching. This left 204 to be sold as market eggs. These 17 dozen eggs, at an average price of 45 cents per dozen, amounted to \$7.65; of her 18 cockerels, 8 were sold as broilers, for failing to come up in some way to our requirements for breeders. We received \$1 each for these 8 broilers. Three of the ten remaining cockerels were sold to other breeders at \$5 each, and the remaining 7 were retained as breeders in our own flock. These we value at \$5 each, making a valuation of the 18 cockerels of \$58. One of the 16 pullets was accidentally killed after she had reached maturity. We kept the other 15 in our own flock, and place a very moderate valuation of \$3 apiece on them, or \$45 for Gloria's daughters.

Gloria's total cash credit for the year 1921 is \$110.65. We figure that it cost us \$2.50 for the hen's feed. It cost us 60 cents apiece for raising the 34 cockerels and pullets, or a total of \$20.40. Adding this to the \$2.50 maintenance charge, makes a total of \$22.90 against Gloria's account. Subtracting this amount from \$110.65 leaves a net profit to Gloria's credit of \$87.75 for her 1921 record.

This is only a cash valuation and does not take into account the added value that Gloria's blood will give our entire flock. For next year every bird will carry in some degree the blood of this great hen.

Gloria is still pegging away, making a very good record for 1922. At present we have ten of her chicks, valued very highly by us, as they are the result of a mating with her best 1921 son.

Now the point I wish to bring out is this, that if we had not trapnested our flock Gloria would have been undiscovered. We would have valued her no more highly than any of the other original 26 pullets, and so would not have been careful to have saved all her eggs for hatching. We would have probably killed her when she was 2 years old and have never been any the wiser or richer for having owned such a hen.

Surely there are many great hens of every breed that are good individuals and wonderful layers that are never discovered because their owners have not given them a chance. And the one great discoverer of this unsuspected celebrity in your own flock is the trapnest.

Penn.

Good Type of House for Growing
Chickens

(Continued from page 793)

can be built of hollow tile, concrete
blocks, bricks or other durable material, and
if due attention is paid to the light and ven-
tilation such houses will be entirely satisfac-
tory.

Probably the most satisfactory material for
walls for a movable colony house is car siding
nailed up and down. Car siding is
usually cheaper than other types of matched
siding and makes a tighter wall than ship lap
or drop siding because it has tongue and
groove matching. Nailing the siding up and
down instead of horizontally eliminates the
use of studding except at the corners. Where
drop siding cannot be obtained a cheap grade
of flooring may be used for the walls and
makes a satisfactory siding. When either car
siding or flooring is used for the colony
house walls there is no necessity for making
double walls or covering the walls with heavy
paper if a workmanlike job of matching the
lumber is done.

For a movable house a board floor is the
only practical type. This should consist of
a single layer of carefully laid tongue and
groove, matched flooring. A double floor is
a needless expense and adds to the
weight of the building.

Most persons con-
sider a shingle roof
more durable than
any of the common
prepared roofings,
and for a colony
house it is lighter in
weight and less likely
to be damaged in
moving than almost
any other type. On
the gable roof colony
house shingles can be
safely used on raf-
ters having a quarter
pitch.

On an 8x10 colony
house very little
framing material is
required except for
the floor sills and
rafters. 2x6 material
is sufficiently heavy
for the sills and
floor joists, while
2x4 rafters are satis-
factory. In a 10x12
house the sills had
better be 2x8 while
2x6's can be used
for floor joists. For
either size house,
four 6-light 8x10 in.
sash windows, ar-
ranged one on the
east, one on the west and two on the
south, will furnish sufficient light. The
windows on the side should be ar-
ranged so that they will slide freely and
those on the south should be hinged to
swing out for use in ventilation. To insure
plenty of fresh air in the house when the
windows are closed a wire covered opening
15 inches wide and 28 to 30 inches long
should be left under each of the south
windows. A muslin covered frame should
be provided for this which can be used to

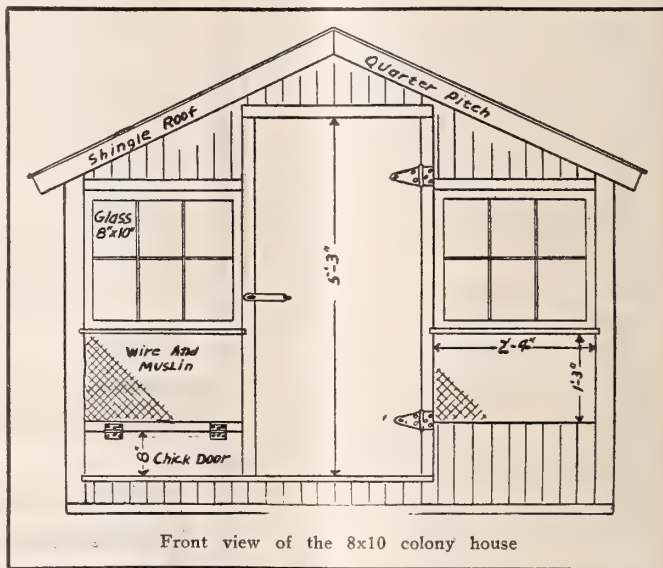

keep out storms. In cold weather added
warmth can be secured in the house by
filling the gable with straw, while in warm
weather the building can be kept comfort-
able by having all windows removed so
that the breeze will blow through the
house.

Cost of Building.

The following bill of material is com-
plete for an 8x10 gable roof colony house
built five feet high at the eaves and hav-
ing a quarter pitch shingle roof. The cost
of this material will vary throughout the
country but \$40 will represent the cornbelt
states. A carpenter of average ability will
build this house complete in three days.

Bill of Material for 8x10 Gable Roof Colony
House

Use	Pieces	Size	Board Feet
Sills	6	2x6-8	48
Sills	2	2x6-10	20
Rafters	8	2x4-5	27

Capons.

A capon is a castrated cockerel, and the operation of castrating cockerels, which is done to improve the fowls for market purposes, is known as caponizing.

A Capon's comb, wattles and spurs, unlike those of a cockerel never develop. A capon never crows, and seldom molts, but on the other hand the plumage of a well fed capon is as brilliant as that of a cockerel.

The head of a capon has a distinctive appearance of its own, being unlike that of either a cockerel or a hen.

A poulard is a pullet with the ovaries removed and the operation accomplishing this is known as poulardizing, hence poularls bear the same relation to pullets that capons bear to cockerels. The operation of poulardizing is not often performed.

Superfluous cockerels can be profitably caponized because they are useful only for the production of meat, but pullets are useful for egg production. In few places is it found profitable to customarily produce both pullets and cockerels for table meat purposes. Because of these facts, only caponizing will be treated in this article.

The two important advantages secured by caponizing, are the production of a greater quantity, and a better quality of edible meat on the carcass of a fowl.

An incidental advantage is that capons can be handled more easily and can thus be produced at a lower cost for the same weight than is possible with uncaponized cockerels.

Advantage of Caponizing.

Capons will gain more flesh than cockerels, from an equal amount of food because the energy that would otherwise go into fighting and supporting the activities of the reproductive organs, is utilized in developing desirable flesh on the birds.

Cockerels as every breeder knows, fight almost continually among themselves and abuse the pullets, if the two sexes are not separated.

Capons attain their marketable size more slowly but grow fully one-third heavier in weight, than cockerels of the same type and variety, at the same age, and the additional weight is almost entirely edible meat.

Capons owe their relative low cost of production as compared with cockerels to their peaceable, contented and generally docile disposition. They can be left to run indiscriminately with males and females during the growing period, or they can be kept in flocks of 500 or more by themselves, if necessary, without showing the least disposition to quarrel, and they can be kept even more closely confined than hens or pullets. They love to cluster together in groups to sun themselves, and to doze until feeding time comes again.

The flesh of an 8 or 9 months old capon weighing 10 or 11 pounds is as tender and juicy as that of a spring chicken, in fact owe their higher selling price per pound and

OLD RELIABLE MAMMOTH INCUBATOR

Again Far in the Lead — Away Ahead

Here is the correct answer to your incubator problems. The growth and development of the poultry business calls for larger plans, larger units, for hatching purposes. The Old Reliable—the standard of all incubators, now presents a grouping sectional system that in every way ranks first. It is far removed from the experimental stage. It embraces all the well known principles of the Old Reliable, the result of 42 years study and effort to reach perfection and produce incubators in style and form to meet the public's demand. The original fundamental principles have never been deviated from. The growth and expansion, and all that adds to ease of operation, convenience and economy, as well as efficiency, have been carefully safeguarded in every change we have made.

The Old Reliable Standard Mammoth

Is made in both hot air and hot water styles, in sections of 1,100 egg capacity. These sections may be used in singles, doubles or three-high. You cannot afford to ignore questions of responsibility and reliability when selecting your equipment. The constant flow of testimonials from satisfied customers is our warrant for the belief that we are offering you the best incubator equipment possible to produce.

The Reliable Sales book contains complete information of our full line of incubators; likewise a complete line of poultry equipment and accessories. We can furnish everything necessary for operating the largest or the smallest poultry plant. Everything we make or sell is supported by a positive money back guarantee.

1000 Eggs in Every Hen

New System of Poultry Keeping—Get
Dollar A Dozen Eggs—Famous
Poultryman

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then, she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860N Herald Bldg., Birmingham, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.

much of their popularity to the quality of their meat. The white meat of a capon is very pure and clear, and the dark meat is much lighter in shade than dark meat of either cockerel or pullet. When roasters are selling for 40 cents a pound, capons frequently bring twice that much. Finished, well-fattened capons make a fine appearance on account of their plump broad breast, so well filled out, that the entire breast bone is hidden with the usual exception of the tip of the point which is seldom covered.

When to Caponize.

Cockerels of the breeds best suited for caponizing may be operated on when between 2 and 3 months of age, but the operation is most advantageously performed just before the combs begin to shoot, or grow rapidly. At this period the birds, if of the large breeds, will be about 10 weeks to 3 months old. Cockerels that are 4 months old or older, should be caponized by experts only, as at such an advanced age the operation frequently proves fatal. Generally speaking the younger the birds are the easier the operation and the quicker the recovery. Young cockerels have but little flesh over the ribs, hence the ribs very clearly seen and the cut can be made very accurately. The best breeds for capons are the Plymouth Rocks, Wyandottes, Reds, Orpingtons and the Asiatics, as cockerels of these breeds are easiest to operate on because they develop their frames first and do not grow much flesh until after they have passed the size best suited for caponizing. When these birds weight from 2 to 3 pounds there is little except skin over the ribs and the spot to cut when caponizing can be easily seen. Leghorns, Hamburgs and Bantams should not be caponized, at least by amateurs as the operation is difficult to perform on these birds and the gains that result are small. Instruments used for caponizing are manufactured by several firms advertising in A. P. J. and the different sets do not vary greatly either in style or price. The essential instruments are a knife for making the incision, a spreader for holding the ribs apart, a hook for tearing the inside membrane, a probe to push aside the intestines, a pair of forceps for removing foreign matter that may get into the abdomen, and a cannula or slotted scoop for removing the testicles.

Besides the instruments mentioned the operator should be provided with an operating table, a means of securing the cockerel to the table, cold water, carbolic acid or some other equally efficient sterilizing medium, a wash basin, a large sponge, small pieces of sponge or absorbent cotton and a needle and white silk thread for stitching.

The cold water and the sponge are used for washing the plucked area where the incision is to be made. The carbolic acid or other germicide is used for sterilizing purposes and should be added to the water so as to make a 5 per cent solution. This strength solution is most used for such operations; less than 5 per cent is too weak to be effective in destroying germs. The use of the small pieces of sponge or the cotton is to absorb any blood that may be spilled in the operation, and they should be sterilized by moistening with the carbolic acid solution. The same 5 per cent carbolic acid solution should be used to sterilize the instruments.

The Operating Table.

The top of a barrel may be used as an operating table, but it is advisable, particularly where much work is to be done, to have a table that is made especially for the purpose. A table about 3 1/4 feet long and from 18 to 20 inches wide will be found to be the most convenient size. The top should be provided with slots and weights for holding the fowl in position. A box or bench for holding the fowl in position. A box or bench for holding the instruments and appliances should be placed near the operating table, and should be high enough so that the operator will not be obliged to stoop much.

Two conditions are essential for successfully caponizing cockerels. The intestines of the fowl must be well emptied of food, and there must be an adequate supply of light, either natural or artificial at all times during the operation. If the intestines are empty when the operation is performed they are not in the way of the operation and are not likely to be punctured by a slight slip of the knife, as would be the case if they were full. A puncture will almost certainly result in the death of the chicken. To get the cockerels in the best condition for caponizing, they should be starved for at least 24 hours prior to the operation, and a fast of 36 hours will put them in still better condition.

The cockerel is secured and held firmly in position for the operation in several different ways. The method I like is to use two noosed cords with weights of about one pound each fastened at the ends op-

Cut Feeding Costs - Triple Your Egg Production

Use the methods of progressive poultry farms to increase egg production and cut feeding costs. Feed NOT DOPE—for more eggs and healthier flocks. Scientific tests—described in Purdue Bulletin No. 253, sent free—prove solid buttermilk triples egg production, makes a bigger profit. Makes a faster growing chicken—easier bringing for market—bringing top-market, milk-fed prices.

posite from the nooses. One of the noosed ends is then slipped over the feet and shanks of the bird and fastened around both legs above the hocks. The other cord is slipped over the wings and then the weights at the ends of the cords are lowered gently over the sides of the table and the cockerel is held in position, usually with the right side exposed to the operator. The weights stretch the cockerel so that its side muscles are fairly tense, and in the best condition to be cut. When the cockerel is in the proper position, the area of skin immediately surrounding the spot where the cut is to be made is quickly plucked clean of feathers and washed with the carbolic acid solution. The making of the cut in caponizing is the real factor in the success of the operation, and the location of the exact spot where the cut is to be made requires the greatest care. When the cut is made between the lower ribs the testicles can be readily seen lying in the body cavity near heavy blood veins. When the cut is made too far forward or too low down it is difficult to locate the testicles and there is proportionately more difficulty in removing them.

The cut should be made between the sixth and seventh ribs, the ribs nearest the hip and between the angle in the ribs and the backbone. These two ribs are the floating ribs, that is, one end of these ribs is attached to the backbone and the other end is unattached, the other five ribs are attached at both ends, one end to the backbone, and the other end to the breast bone. If the cut is made in the proper place between the sixth and seventh ribs, it will be directly above the testicles, and this is the only spot where it can be made with entire safety and to advantage.

To locate the exact spot at which to make the incision, place the first finger of the left hand on the body of the cockerel directly above the thigh. Pass it slowly with a gentle pressure toward the head of the fowl until the first obstruction is met. This will be the seventh rib of the cockerel. Slip the finger over this rib and press the tip of the finger down firmly between the two ribs at a point about half way between the angle of the ribs and the backbone to serve as a guide for cutting.

The operator is now ready to make the incision. Keep the finger that is pressing down between the sixth and seventh ribs firmly in place, and insert the knife to a depth of $\frac{1}{2}$ inch, with the cutting edge towards the breast bone. To aid the beginner a scratch can be made across the knife blade $\frac{1}{2}$ inch from the point. Draw out the knife but still hold the finger firmly in place, turn the knife blade around and again insert it with the cutting edge towards the back bone. Cut along between the ribs until the backbone is nearly reached. The experienced operator need not make the cut more than an inch in length but the beginner should make it as long as the space between the angle in the rib and the backbone will allow and then put a stitch in the middle of the cut after the operation is finished.

The operator must be careful to cut in a line with the veins, not cross wise of them, and not too near the backbone. By pressing the tip of the finger between the ribs during the cutting operation, the skin is held taut and prevented from slipping back and forth and increasing the chance of having the cut in the wrong spot.

As soon as the cut is made, the knife is laid aside, and the spreader is inserted in the wound. The sixth and seventh ribs are held securely by the hooks at the end of each arm of the spreader and the spring of this instrument is allowed to separate the ribs far enough to make an opening of $\frac{3}{4}$ inch. When this point is reached the spreader should be locked by means of the catch. If the spreader will not remain in place by itself it must be held in place by the hand not employed in removing the testicles which is usually the left hand.

Looking down into the cavity, the film-like membrane that encloses the abdominal organs will be seen. This is usually severed by the knife during the cutting, if not, the knife should not be used again as there is danger of cutting the intestines, because they lie very close to this membrane. The membrane should be torn apart by the hook. This hook must be used carefully or an artery or an intestinal wall will be punctured.

If the cockerel has been starved sufficiently so that the intestines are practically empty and lie down and away from the backbone after the membrane is ruptured, the right testicle will be in plain view up against the backbone. The testicle is a

Queen Incubators
are built in sizes
70 egg to 1000 egg

Queen Incubators

400 to 1000 EGG CAPACITY

These larger Queens are for people who want to speed up production. They are wonderful machines—you can trust them with your big hatches. We have sold 275 of these to one man at one time.

Queen larger Incubators, like the small ones, are noted for their large hatches of **Strong, Healthy Chicks That Live and Grow**

The Queen is built of genuine Redwood, which does not absorb the odor from hatching eggs, to weaken later hatches. The Queen hot water system prevents the eggs from drying out and provides ample moisture for the hatching chick.

The Queen is the only Incubator that carries out the double Redwood wall construction all around, and provides a double wall front, in the way of two separate doors.

Queen Incubators and Brooders are sold by the best dealers in poultry supplies in almost every town in the United States. If your dealer can't show you a Queen, write us and we shall tell you where to find one. *Free book on Queen Incubators and Brooders. Ask for it.*

small bean-shaped organ, yellowish, or yellowish white in color. It is attached to the back bone by means of small ligaments. Directly below the testicles is a comparatively large artery which may be ruptured and cause the cockerel to bleed to death unless the operator is very careful. If the intestines hide the testicle from view, either because they are too full of food, or do not lie in the proper position or from any other cause, they should be gently pushed towards the breastbone by means of the forceps or a probe.

Either the cannula or a pair of forceps is commonly used to disengage the testicle from the backbone and remove it from the interior of the cockerel.

If a cannula is used, insert it in the cavity, slip the wire loop in the end, over the testicle and draw the wire tight. Do not jerk but with a slight twisting motion work the cannula back and forth to assist in detaching the ligaments that hold the testicle. If drawing upon the wire does not sever the end and loosen the testicle, twist slightly from one side to the other, until the testicle is free. When working with a cannula particular care must be taken that the artery beneath testicle is not torn or injured in any way.

If the forceps are used they should be held in the right hand and inserted in the wound slightly opened. Take a firm grip with the spoons of the forceps on the cords below the organ and with a half turn the testicle is severed from its support and it can be drawn out and thrown away.

If a slotted scoop is used this instrument is lowered into the cavity and placed below the testicle, then it is moved so that the cords back of the testicle are slipped into the slot in the center of the scoop. These cords are severed as the scoop is pulled upwards and the testicle is left lying in the scoop of the instrument.

To take out the second testicle the operation is duplicated on the opposite side of the fowl. This method is always recommended for novices in the work. However, when the operator becomes experienced, the left testicle can be taken out through the incision made to remove the right one. In this case the lower, or left testicle is always removed first, as it is the most difficult to remove. After the right one is seen against the backbone, take the probe or forceps and gently push the bowels away from the backbone, and the left testicle will be seen immediately below the right one, on the opposite side of the slight ridge of bone in the center.

No matter how the work of removing is done, both testicles must be entirely removed, as the slightest particle left will cause a growth of the organs, and result in the production of a slip, which is a bird that is part cockerel and part capon, but which will not fatten any better than a cockerel, nor produce any better quality of meat. It will also resemble a cockerel in being quarrelsome. Slips look like imperfectly developed cockerels, and will usually crow and molt like cockerels. Where caponizing is done on a large scale there is likely to be a considerable number of slips. They are useless products as compared with capons, and should be disposed of as ordinary dressed poultry as soon as their true nature is discovered.

Mass.

R. L. Chamberlin.

Popularity Depends on Profits

Many of the old breeds which were once so popular have long since had their day and the popularity of others seems to be on the wane. We hear of remarkable new breeds which are said to be capable of great things, but whether some of them are ever numbered among the really popular breeds remains to be seen. It may be profitable, just for a moment, to consider the points a breed must possess to become popular with poultry keepers and the reason why some of our famous breeds have occupied a foremost place in several countries.

Attempts have been made on many occasions to popularize a breed by booming it greatly, but no amount of booming will ever make an inferior breed a really popular breed. To be popular a breed must not only come to the front, but it must be worthy of staying there. An advertising campaign will certainly succeed in inducing poultry keepers to take up a new breed, but it will never prevail upon them to stick to it if it fails to stand the test. The breed which is taken up today and discarded tomorrow is not a popular breed in any sense.

In England today several new breeds are being boomed tremendously. Birds are being brought right from Australia and sold at pretty stiff prices. They come with a great reputation, but whether they are going to fulfill all

Shoemaker's Poultry Book and Almanac for 1922

Send for it NOW!

The book has about 200 pages, with many colored plates of fowls true to life. Tells all about chickens, their cost, their care, and diseases and remedies.

It also tells all about incubators, their prices and operation. All about poultry houses and how to build them. It's an encyclopedia of chicken-dom. You need it. Only 20 cents. Your money back if not satisfied.

EGGS AT AUGUST PRICES NOW
Send for circular—it contains prices that will interest you and everyone else, and it's free for the asking. There are thousands of the best breeders for the coming season hatched during July and August.

Successful Poultry Culture

By Clarence Ward. Proven facts based on practical experience in accordance with scientific laws. Shows how you can build up a well-paying business with a few dollars capital. The chapter showing how to save three-fourths of your feed bill is alone worth many times the price of the book. Price 50¢ postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

the claims made regarding them has yet to be proved. One can be certain that so long as the boom lasts those at the top will be doing very well, but whether the new breed is going to oust some of the older ones from their position depends upon what the ordinary man thinks of it after he has given it a fair trial.

There is not a doubt that appearance counts to a certain extent. Most poultry keepers like a bird which looks attractive. White seems a favorite color, probably because a white bird, when it is clean, possesses a very smart appearance. The white bird is not a favorite, however, simply because it is white. Thousands of poultry keepers stock white fowls who are not prejudiced in any way as regards color and some of these would prefer a black breed but they are afraid they would lose a little in profits if they made a chance. Whilst the famous white breeds live up to their reputation and continue to shell out the eggs we may expect them to remain popular.

The ordinary poultry keeper has one main idea in keeping poultry which may be summed up in one word: profit. He may be fond of his fowls, and a few may look upon them as a kind of hobby; but the great majority expect them to pay their way. Only a few, comparatively speaking, make money by exhibiting and selling sitting eggs and stock birds. It is the commercial egg and table chickens which yield by far the greater part of the profits, and large numbers of poultry keepers depend upon these entirely for their receipts. To be popular with these people, therefore, a breed must possess sound economic qualities, for the majority will always plump for the breed which they believe to be the best payer.

Breeders must remember that it is not necessarily the breed which they themselves believe to be the best which is going to make the most headway, but the one which gives the greatest satisfaction to the largest number of their customers. They must study the requirements of the ordinary man and try to produce a bird which suits him better than the one he now stocks. The question is some times asked whether we need more new breeds and whether there is room for them? It can be safely stated that there would soon be plenty of room made for a breed which proved itself to be a better payer than any of the present day varieties. Whether it is possible to produce such a breed is a matter which need not be discussed here, but if such a one should arrive its success is assured. It would not matter whether it originated in America, England, Australia, Holland or any other country, it would soon become a popular breed. Poultry keepers, like every other class of people, will make lots of excuses for keeping anything which really pays them and they will look over a lot of minor defects whilst the profits keep coming. It is not everyone who can afford to keep fowls simply for the love of the thing and when you are depending upon the profits for a part or all of your living, the bigger they are the better.

A few enthusiastic fanciers may keep a breed in existence for years, but no breed can become popular and remain popular for any length of time which does not satisfy the requirements of the majority of poultry keepers. It is not a few sensational producers which are needed. It is the flock which gives the best results with the least expense that yields the most profit. Those breeders who are anxious to push a new breed must pay the greatest attention to the economic qualities. All other points are only of minor importance in comparison with these. John W. Moore.

Want Judges Protected

"When judges of national reputation become so steeped in crime that they can no longer be trusted to render unbiased decisions, the exhibitors should have some sort of redress."

The above clipping was taken from the International Plymouth Rock Journal.

We feel it a duty to our recognized honorable judges that some action should be taken by the American Poultry Association for the proof of such statements or that a public apology be forthcoming.

In case no satisfactory action is taken by the American Poultry Association; we, The League of American Poultry Shows, will take such action as we deem necessary.

In all our advertising we go on record as favoring papers which publish show awards in full.

League of American Poultry Shows

D. Lincoln Orr, President.
Harry W. Britton, Secretary.

Note: On top of the above slam against "judges of national reputation," the publication above referred to by Messrs. Orr and Britton, disregards the copyright laws, and reprints in its July issue the Standard ideal Columbian Plymouth Rock male from the American Standard of Perfection. It is time for the A. P. A. to recognize these unwarranted attacks.

Camden, N. J.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

Could you give us any information in regard to the two new plums, Burwood and Loring Prize? We have planted a number of Waneta, Omaha Gold, Sopa is a fine plum. Do you know of any other good plum for the Southeast Wisconsin? We can raise all varieties of pears and York Imperial, Spitzenburg, Gunes Golden and other apples that they cannot raise farther north.

Wisconsin. Dawson Bros.

The new plums have not as yet been widely distributed and it yet remains to be seen where they will do best or for what sections of the country they are best adapted. Advise you to try out a few trees of each. You will find the Terry plum a valuable addition to your collection of valuable plums. It is the largest of all native plums and should be in your collection.

* * *

Understanding you are familiar with the apple and fruit section of Virginia, I take the liberty to come to you to ask if you could suggest a section that I might look up with this object in view; a climate better suited for one troubled with catarrh, a location near a large center so children may attend high school, and such a center a good market for the products of truck and poultry. With both lines I am familiar. Would like to raise strawberries, asparagus, currants, gooseberries, apples, etc. Could you suggest the best varieties for such locality?

Wisconsin. Fred C. Luce.

I advise you to make a personal inspection of the Valley of Virginia, going to Roanoke, and other sections of the valley. It is an ideal section in all that makes life worth while. The climate is mild and pleasant. The water is the best. It is an ideal fruit section, also fine for small fruits and vegetables. Investigate also the Piedmont section lying on the eastern slope of the Blue Ridge mountains. Go to Charlottesville and work out from there, covering the entire section. There is no better place in all the world to live than in Virginia.

* * *

What are the varieties of apple, pear, cherry, peach and apricot trees that would do the best in Southern Missouri? Also, which would be the best kind of strawberries and raspberries for that place? We own a farm in Taney county, Mo., and are improving it as fast as we can before we go there to make it our home.

Oklahoma. F. W. De Verse.

The best commercial apples for Southern Missouri are Delicious, Black Ben and Champion. You will find the Lincoln and Kieffer the best pears. Plant Stark's Early Elberta, J. H. Hale, Elberta and Krummel peaches. The Montmorency cherry is best of all. The best apricot is the Steela. The Royal Purple and Cuthbert are the most profitable raspberries. Senator, Hoveland, Sample and Gibson strawberries will give you big profits.

* * *

I have about one-half acre of black soil gently rolling to the south, on which I wish to plant a few fruit trees, mostly apple, and also a few berry bushes. What would you think of Grimes' Golden, Jonathan, Snow, Starks Delicious and McIntosh Red? How far apart should the trees be set? Is thirty feet each way far enough? Can berries such as raspberries or blackberries be grown between rows? What would be a good variety of each of these? What kind of cherries would do well here?

Do fruit trees need spraying before they come into bearing? Is it too late in the season to set fruit trees after May 1st?

I wish you would give me your opinion of the best trees to grow in this part of the country and any changes that you suggest will be appreciated. I live in Bureau county, Illinois. Oscar Baird.

The varieties of apples you name are all good and suitable to your climate and soil. Thirty by thirty feet is all right for the planting of apple trees. Raspberries and blackberries can be grown between rows, but I advise you to raise corn and potatoes instead. Royal Purple and Cuthbert are the best raspberries. Ward is a good blackberry. Montmorency cherry is the best of all cherries. The fruit trees should be sprayed with Black Leaf 40 if the aphid is working on them. When dormant in fall they should be sprayed with Scalecide and again in spring before growth starts. Would add Henry Clay to apple list. This is the earliest of all apples, is hardy and a good quality of fruit.

* * *

On June 15th I received from Stark Bros. Nurseries and Orchard Co., Missouri, a Golden Delicious apple with note which read:

"The enclosed sample of Golden Delicious was shipped by express, 2,100 miles last fall, was opened and examined, and then re-shipped to storage. They have been taken out of storage and examined twice since last fall.

"This sample is taken out of a box that was opened up on June 14th, and is representative of the entire box, which showed no indication of deterioration so scald. This sample, in leaving us, appears to be in perfect condition and still retains its original juicy, spicy flavor."

This specimen was in perfect condition. The wonderful and unequalled flavor was unimpaired. The beautiful golden yellow color was in full bloom. I have been very insistent in my advice to orchard planters that they plant Golden Delicious. Delicious and Golden Delicious are the two high quality apples. They will always command the highest market price. In tree they are exceedingly hardy, and are heavy and consistent bearers. I think the tests to which Stark Brothers have put their Golden Delicious apples, of which the one here referred to is a sample, are the most severe tests to which any apple has been called upon to withstand. It is a wonderful record.

* * *

Will you kindly tell me what varieties of fruit to grow in Northern New Jersey for home use?

New Jersey. C. H. Hillmuth.

Apple: Henry Clay, Yellow Transparent, Wealthy, Delicious and Golden Delicious. (Continuous supply.)

Peach: Stark's Early Elberta, Elberta, Red Bird, J. H. Hale, Krummel. Undoubtedly there is a local seedling peach which is equally adapted to your soil. Investigate.

Pear: Seekel, Lincoln, Kieffer.

Plum: Abundance, America, Omaha, Terry.

Sweet Cherry: Lambert, Schmidt, Windsor.

Sour Cherry: Montmorency.

Apricot: Steela.

Quince: Van Deeman, Orange.
 Strawberry: Consult your near-by commercial growers.
 Raspberry: Royal Purple, Cuthbert, Cumberland.
 Currant: Fay, Red.
 Gooseberry: Oregon Champion.
 Blackberry: Ward, Snyder.

* * *

I have a large Northern Spy apple tree about 25 years old, I noticed one of the smaller limbs on this tree was dying. I found the larger limb from which this smaller limb branched off showed signs of having been worked on by some insect. The larger limb had quite a few holes, made by birds seeking the insects. We will cut off the small limb that is dying and will chisel out the wood where the insects have been working, but would like to know with what to treat the holes where we have chiseled? Is concrete all right? We have frequently chiseled out trees and filled the cavity with cement. The balance of this tree, other than this limb, looks healthy. Could the trouble be due to borers? The information we seek may possibly not be in your line of work, but any suggestions or help will be greatly appreciated.

Where and how can we obtain bulletins on subjects of this kind? Also would you kindly write us where we could obtain a book on "Orchardry?" I mean a reliable book on fruit growing and the care and treatment of trees. Ohio.

Mrs. Jese Wilson.

The injury to this tree is no doubt caused by blight, which has caused decay. Advise you to cut off limb which is dying. Try to cut very close to the body. Wash exposed part made by removal of limb with carbolic acid solution. When dry, paint with white lead and boiled oil. Be sure no turpentine is in this paint. Clean out all holes and wash with the same solution. Fill holes with cement. You should spray the tree with Scalecide each fall and spring when tree is dormant. You can get the book "Orchardry," of American Fruit Grower, Chicago, Ill.

* * *

I have read with considerable interest, several articles by Mr. Thomas Rigg on the subject of poultry and fruit farms in Virginia and Western North Carolina. I expect to make a trip down there next week to look the situation over, but I am wondering who to get in touch with to get what information that I might desire. Would it be best to look up a county agent? Would like to know the location of the agricultural experiment stations in these states or any institution that might give some information.

Wisconsin.

A. H. First.

I advise you to go to Asheville, and there get in touch with the fruit growers; from there go to Waynesville. Here are located some of the finest apple orchards in the state. Yes, connect yourself with the county agents. In Virginia go to Staunton, Waynesboro, and Charlottesville. There you will get in touch with some of the most successful fruit growers in all the United States. Take your time and "look and listen."

Our Cover

The male on our cover this month represents a Black Giant. This breed was originated in New Jersey as a large, roaster breed. It has been refined and improved by fanciers, and its breeders are now seeking recognition for it as a Standardbred. It is proposed to make the Standard weight for Black Giant cocks 13 lbs., which would make the breed the heaviest in the Standard. There will be considerable discussion on this and other debatable points at the annual meeting of the American Poultry Association this month. The Jersey Black Giant is supported by a very strong specialty club which counts among its members competent breeders and influential fanciers.

Secrets of Expert Exhibitors And Easy Lessons in Judging

By FRANK HECK

THE time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest faker and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system of so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! Don't put off sending your order. You need the book NOW. The price of the book is, including postage.....

\$200

AMERICAN POULTRY JOURNAL

523 PLYMOUTH COURT

CHICAGO, ILLINOIS

600 Pages, 340 Illustrations and Plans, Fully Indexed, Cloth Bound

Price \$3.00, Postpaid

PARTIAL LIST OF CONTENTS
 American Poultry Industry: Origin of domestic fowls, magnitude of the industry, tables showing the numbers and kinds of fowls raised in different states, export trade, average prices on poultry and eggs in leading markets for past twenty years. **Analysis of Standard Breeds:** Description of each variety, not alone from the fancier's standpoint but according to utility qualifications, including sixty pen drawings of ideal types by a leading poultry artist. **Companions of the Hen:** Special chapters on ducks, geese, turkeys, guinea fowls, and pigeons, care and feeding, market value. **Incubation and Brooding:** Natural and artificial methods, how to choose equipment, incubator management, selection of hatching eggs, fertility, baby chick industry, sitting hens, testing eggs, how to build incubator cellars and brooder houses. **Poultry House Construction:** Designs for all kinds of buildings, laying houses, colony houses, brood coops, curtain-front and open-front houses, interior fixtures, nests, perches, watering systems, labor-saving devices. **Feeding:** Analysis of foodstuffs of every description, how to compound rations for poultry of all ages and for all purposes, formulas recommended by leading authorities, feed hoppers, mixers, carriers, methods of distribution, records, storage-bins, costs, forced feeding, fattening, sprouting oats. **Diseases:** Symptoms and causes of all common ailments, remedies, with special references to white diarrhea, worms, and vermin, how to make disinfectants and dusting powders. Five chapters are devoted to the treatment of diseases. This is a treatise in itself. **Breeding:** Management of stock for increased egg production, selecting males, trapnesting, hybrids, pelvic bone tests, precocity, capacities of hens, pedigree breeding, marking fowls. **Management:** Advertising, selling, methods, marketing, canning, by-products of the poultry flock, including the preservation and uses of manure, feathers, and so on; shipping instructions, preparing birds for exhibitions, preserving eggs, killing and dressing poultry, practical study of the formation of eggs, embryology, measures that prevent mortality among chicks, broiler raising, importance of good business methods. **Equipment:** Working plans and instructions on how to make all kinds of poultry appliances, self-rising doors, ventilators, catching coops, broody hen boxes, trapnests, fattening pens, egg candlers, feed hoppers, erecting poultry netting, racks for sprouting oats, hatching egg cabinets, electric egg tester, outdoor incubator, colony brooders, feeding frames, etc. **Commercial Poultry Raising,** in fact, is an encyclopedia brought right down to date. A copy should be in the hands of everyone who wants to make a profit from hens.

CHAS. L. STILES,

232 N. Third St.,

COLUMBUS, OHIO

In Defense of the A. P. A.

By V. O. HOBBS,
Member Executive Committee.

Those who have not studied the problems fairly and intelligently are apt to misjudge the work of the American Poultry Association after reading the harangue of its vilifiers.

For this reason, many loyal to the cause have grabbed their pens and begun to sling ink in defense of truth, fairness and common sense. And they have already done splendid work. Every single, solitary lie has been nailed.

The American Poultry Association was established for an express purpose and with but one object in view, and that purpose has never been changed, nor its object lost sight of. It is still intent on advancing the interest of the poultry industry.

The A. P. A. has long since passed the experimental stage; it is a time-tried and test-proven establishment. It is financially solid and its credit gilt-edge. The association has been a tremendous success, it has made the poultry industry what it is today.

The association has a faculty of live men—living in the present and building for the future, all working for a common good and a common purpose, mutual benefit.

The present officers are capable and conservative business men; progressive and aggressive, but having a full realization that they are responsible and accountable for the income and the outgo.

Those who have taken the time to find out, know how well they have conducted the affairs of the association, and what they have done for the poultry industry in general.

These men, almost without exception, are nationally known as successful breeders, exhibitors and judges of Standardbred poultry. Therefore, to some extent at least, their own success is dependent upon the success of the association they represent, which means that they could ill-afford to do anything that would be detrimental to the interest of the poultry industry.

The officers of the American Poultry Association were elected by a majority vote of its membership. They have "made good" and merited the confidence placed in them.

The president, T. F. Rigg, has distinguished himself as a clear-headed, far-sighted, co-operating administrator of the affairs of the association. Mr. Rigg is a breeder and judge of poultry, a man of affairs and his time is valuable. His work in the association is a labor of love, as he is not reimbursed for his services. The only conclusive evidence of a man's sincerity is that he gives himself for a principle. It is comparatively easy to give money and advice, but when a man makes a gift of his daily life and practice, it is plain that his heart is in the work, and that a purpose, whatever it may be, has taken possession of him.

During the past year much has been done to restore harmony among rampant elements in the association. At the convention, which was held in Kansas City, a committee of 40 was chosen, the purpose being to bring these warring factions together and to promote peace and good will among its members.

A new Standard Revision Committee is appointed every year, which absolutely precludes the possibility of unfairness or favoritism. The work of the committee is to consider carefully all facts brought to its attention and to use its best judgment in arriving at a standard, and even then its decision is put up to the association for acceptance or rejection as it may see fit.

There is no justifiable reason for internal strife. Co-operation and constructive effort is the code of ethics that all should espouse and observe.

The highest faculty of mind is the constructive faculty. The builder is a strong man and is not to be feared. The trouble comes from the narrow mind, the man who seeks to tear down and destroy. It is well to keep an eye on him.

There is a cause for everything. The man with a hammer is usually the victim of disappointed ambition, self-torturing, envy and conceit.

Show Managers to Meet

I have called a meeting of poultry show secretaries for Monday, August 7th, at the Farragut Hotel, Knoxville, Tenn. The show managers of this country have the undeniable right to formulate rules and regulations governing shows, and it is the duty of the American Poultry Association to adopt the rules and regulations recommended by the show managers. It is up to the show managers to make these rules, and I hope they will do so at this meeting.

T. F. Rigg.

Poultry Without Lice

The U. S. Dept. of Agriculture Bulletin 801 says there is no fundamental reason why a flock should not be entirely freed from lice and maintained so. After a number of their tests with different materials, nothing else was found to be so effective and satisfactory as

SODIUM FLUORID

Clemson Agri. College, So. Carolina, says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried." Twenty-one other State Agri. Exp. Stations say the same. Also effective against cockroaches—water bugs, ants and plant lice.

IVO-SAN SODIUM FLUORID is air-floated, fine as flour, of highest grade, but costs no more. Two pound can, with copy U. S. Bulletin 801, \$1.00, postpaid. Send for free sample, if you want to test it first. Send today—solve your lice problem.

The IVO-SAN LABORATORY

219 Prospect Ave.

Cleveland, Ohio

THE OLD RELIABLE LAMBERT'S DEATH TO LICE

Insures Clean Fowls—Larger Profits

It has been the Standard Lice-Killer for over 30 years—the standby of Successful Poultry-keepers. Easily used, absolutely safe, sure and quick in results. Most economical because it goes farthest. Try it and see young fowls grow faster and hens lay. Prices \$1.00, 50c, and 25c per Package. Sample 10c. Head-Lice Ointment 25 and 10 cts. per box. If not at your dealers, send direct, including postage for mailing. Address

THE KLEIN-LAMBERT CO., 515 Traders Bldg., CHICAGO

SPIRALETS LEG BANDS

Call for a New Constitution

By Theo. Hewes.

(Editor's Note: Mr. Hewes deals with a serious matter, although he injects some humor into his remarks. Those who know him appreciate that his fun is always meant to be good natured. We believe that Mr. Hewes' article deserves attention because he has offered to take the A. P. A. and promised, under his management, to put money into the treasury before accepting compensation for his services. A man who has confidence enough in himself and his proposition to make such an offer deserves respectful consideration from those who are interested in the A. P. A.)

A petition was submitted to President Rigg by the Revision Committee, requesting him to appoint a committee to revise the constitution and by-laws of the American Poultry Association. This petition was submitted by Mr. Schwab, but bears the signatures of the Revision Board and others and was sanctioned by both Mr. and Mrs. Rigg.

In view of the fact that this matter will come up at Knoxville, at which time the committee to draft the new work will be appointed, a few words from me, as one of the signers of the petition, will no doubt be of general interest to the readers of the American Poultry Journal.

First, I want to say that I was opposed to the adoption of the present constitution. There were several reasons for this, but the principal reason was that it disfranchised more than 99 per cent of our members and placed the affairs of the association in the hands of an executive committee of 10 members. It gave the members no chance to vote their choice of location of the annual meetings, and it was entirely too long and complicated to be a workable set of rules for the ordinary member to understand. It raised the price of membership without giving the member any more for his money, and it failed to throw sufficient safeguards around this membership fee to make it of real financial benefit to the association. These are a few of the reasons why I opposed the adoption of the present constitution and it would seem to me they are sufficient to prove my position was right, regardless of the roast I received from our late president and some of the other members of that constitutional committee. To tell the exact truth about it, I really believed that constitution was going to wreck the old machine, and it is a notorious fact that it has come precious near doing it.

There are two ways to get out of a financial hole: One is to make more money; the other is to spend less of what you have. What this association should do, and can do, is to make more and spend less; and when we show to the poultry world that we are doing this, we will have more new members and be respected a great deal more by the old members.

There is no doubt in my mind that more than 75 per cent of the men and women who are breeding Standard poultry in the United States and Canada would join the American Poultry Association if we would adopt simple working rules that would enable us to create a large sinking fund and offer them something real for their membership. When we back a man up in the corner and take \$25 of his money for life membership in the A. P. A., what do we give him in return? And what is the use of trying to show a convention how to cut down expenses and make its membership of greater value when two or three wind jammers that have never made good in their own business can take the floor and talk the convention to death? When we stop to consider that this poultry journal has nearly 100,000 subscribers, yet we have less than 4,000 real live members, it makes us look like the tail end of nothing. It has been the constant trying out of new and useless ideas that has brought this condition about. The American Poultry Association is primarily a mail order business, and as a mail order business there is no limit to it. We can make it as big as we want it if we will only use ordinary good horse sense. You can't give \$6 for \$5 and stay long in business; neither can you spend your income and build up a surplus.

We talk about a billion dollar industry as though we represented it. But we don't represent the pip end of an egg shell, yet. Of the millions of people who make the billion dollar business possible, it is a safe bet that not 1 per cent of them ever heard of the American Poultry Association, so let's not swell up to the bursting point just yet.

I have just looked over a copy of the constitution and by-laws and it seems the framers did a good job in finding positions for all the worthy brothers, as it takes 48 members to fill all the offices. It reminds me of the morning after a city election, when our side wins, and we are trying to find the names of all buildings in the city limits where we can

Poultry Books at a Cut Price

A complete poultry library that covers every phase of the industry. \$5.00 complete poultry library for only \$5.00. A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and by taking them all at a cut price, you will be well equipped to make a success of this business.

Save One-third by Ordering Six or More of these Books Now

How to Raise Chicks, by Dr. Prince T. Wood. A down-to-date manual on breeding poultry, getting hatchable eggs, incubation and brooding, both natural and artificial, preparing chick foods, feeding chicks, how to raise chicks and how to avoid and prevent diseases and losses. Tells how to make your own brooders and chick foods. 128 pages, 35 illustrations. Price 75c postpaid.

999 Questions and Answers, by Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information and right to the point. 124 pages. 75c postpaid.

Poultry Account Book. This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. A guide to making your business more profitable. Printed on paper suitable for ink. Price 25c.

Open Air Poultry Houses for All Climates, by Dr. Prince T. Wood. Tells plainly just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by successful breeders. 75c postpaid.

Origin and History of All Breeds of Poultry. Tells you where the breeds originated, what varieties were crossed to produce certain qualifications in a new breed; how they were recrossed until perfect. Postpaid, per copy, \$1.00.

A Revolution in Egg Production, by George C. Newell. Read this book and learn how you can lengthen the hen's working day in winter by the use of lights in the hen house when egg yield is lowest. It shows how you can increase the winter egg yield 100 per cent. Cloth bound, \$1.00 postpaid.

\$4223.00 in One Year on a Town Lot, by H. Cecil Sheppard. Shows how with a very limited knowledge of the poultry business and small capital, he built up a profitable business. Cloth bound, price, \$1.00 postpaid.

HOLTZAPPEL HATCHERY

ELIDA, OHIO

place a janitor. It covers more ground than an Arkansas Standard Oil lease, but it does not mean quite as much. As a work of art it is there with both feet, and as a literary gem it is some real constitution. Every i is dotted and every t is crossed and according to Hoyle; every And and every The is in the proper place. You will note that I refer to Hoyle, as his is the reference book most in use in this mountain country, and more money changes hands in one night in Hot Springs on his rulings than is spent on all other reference books in one year in the entire state. In fact everybody quotes Hoyle from the barefooted kid that can hold three cards between his toes, to the old timer that has chewed hill side ter-back-er for 40 years without a tooth in his head. If you don't think they know the rules stand pat on a bob tail and watch them fill their hand. Its real heart breaking, but it will prove the point.

I wonder how many of the readers remember how this new constitution got its start and how it happened to go over with a bang? We had a pretty good old constitution and one that we seemed to be getting along with in fairly good shape, but Frank DeLancey got sore at it about something and started trouble for it, and when DeLancey starts trouble for anything it is back to the discard and no questions asked. Into the discard the constitution had to go and DeLancey went after a new one and got it.

But now that we have the new one, and the darned thing won't work he is sore again, and he says now we must have one that really represents the entire membership; in fact he is for a democratic form of government, all-the-people-for-all-the-people kind of constitution, and we are for him this time with both feet. We tried to point out a few holes in the last one but he had not gotten over that speech he made in Chicago and he wouldn't listen.

Do you remember that speech? It was a ten strike. I have always wanted to be an orator and I have been about half jealous of Frank DeLancey ever since he turned loose that broadside. Boy, that was some speech; it stopped everything in Chicago, including the elevated trains two squares away. Edison may be a wise old owl but he overlooked about one and a half million cart wheels when he failed to get a record of that wild outburst. DeLancey started trouble by one of the greatest arm movements ever invented; in fact he made a Dutch wind mill look like a selling platter. Horace Murphy kept trying to get out of his way by moving back a few rods at a time, but finally had to climb on top of the piano in order to feel safe. He talked about everything (except the constitution) from the landing of the Pilgrim fathers to the last round in the most recent prize fight. Everybody was all excited. I got so worked up that I did not know whether I was coming or going, and after it was over and the applause had died down, I was so excited that I went over to Dick Richards and asked him what DeLancey had been talking about. That proves how one can mesmerize an audience.

There are about five changes needed in our present constitution that are of vast importance to the A. P. A. I am of the opinion that these changes could be brought in to the convention by the executive board as a part of their report and be adopted at Knoxville, and if such a thing could be done, it would stop a general revision with its big expense and useless rag chewing. But before these changes can be made it is necessary to outline a working plan that would meet with the approval of that board, for they and not the convention are the power that be.

It will be up to the president to name the committee to draft the new constitution, and I, like the rest of the members, have no idea who will be appointed to this committee, but if he really wants to make a million dollar A. P. A. of it, he will think twice before naming this committee. I am ready to go before the executive board with a few suggestions at such time as I am convinced they want to stop, look and listen. But if they are satisfied with present arrangements and want to go on standing still, or are going to be swayed by outbursts of oratory and then go home and kick themselves as they have done in the past, there is no use suggesting anything. We have the making of one of the greatest and wealthiest organizations in all America, but whether we have the men with sufficient vision to put it over is another story. I am looking ahead to the Knoxville meeting with more than common interest. There is a lot that can be done there to regain some of our lost prestige, or we can so stifle the aims of the real workers that we will accomplish nothing. Let us hope for the best and all work for the accomplishment of the thing that means most in all organizations, harmony.

AMERICAN POULTRY JOURNAL

523 Plymouth Ct., Chicago, Ill.

Why Poultry Pays and How to Make It Pay

An entirely new book and different from our old book of similar name. Tells you how to raise poultry from the "money-making" point of view; gives the beginner sound advice about starting in, tells the approximate cost of land, buildings and fowls necessary to start a market poultry plant, and also gives valuable suggestions on the Winter egg question. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

How to Build Poultry Houses

A new book just out, devoted exclusively to the building of poultry houses of all kinds and descriptions. Besides telling how to build the houses properly, it tells how to make feed troughs, nest boxes and water troughs. It gives complete plans, as well as the approximate cost of construction. It also contains plans of roosts and dropping boards; the brood coop; the brooder house; the fattening coop; the Winter the brooder house; the fattening coop. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

Classified Advertisements

Under this heading ads will be inserted for eighteen cents per word each month for less than three months, or forty-five cents per word for three months. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under classified headings. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from American Poultry Journal than from any other poultry journal—none excepted. On writing any of these advertisers, mention American Poultry Journal. All copy for Classified Ads must reach us by the 17th of month preceding date of issue. These rates void after May 20th, 1923.

The feed that has never been equaled in number and quality of chicks raised. Produces 1 pound of gain in weight for each 2 pounds of feed consumed. Feed it after 4 weeks for six months and your pullets are ready to lay. Nothing like it ever before placed on the market.

Now made under Mr. Angell's original formula, improved with Buttermilk. It will positively produce more eggs at less cost than any feed known. Feed it alongside of any other mash you may select and the results will amaze you. It is the cheapest in price because it produces more eggs.

How Vitality Feeds are Made

Be sure the signature of Albert Angell, Jr., is on every sack of Vitality Poultry Feeds, with our guarantee of absolute satisfaction when fed according to directions.

In manufacturing our poultry feeds we are not interested in the use of low quality ingredients, regardless of how attractive the price may be. Our successful experience in poultry raising is sufficient reason for our refusing to allow in our mills any ingredient off in condition, or of otherwise low feeding value. Such ingredients as Oatmeal, Buttermilk, Meat Scrap, Bone Meal and Alfalfa Meal are the most important that enter the manufacture of any mash feed, whether for hens, chicks or growing fowls and each must be in the best of condition and of highest feeding value to make them fit for feeding.

For this reason, Vitality feeds may cost more than others, but in actual feeding results the cost is reduced far below that obtained from the low quality and low price products. True, you will have no difficulty in obtaining poultry feeds costing less per 100 lbs. than Vitality can be made for, but our advice is—take it from one who knows—Don't do it.

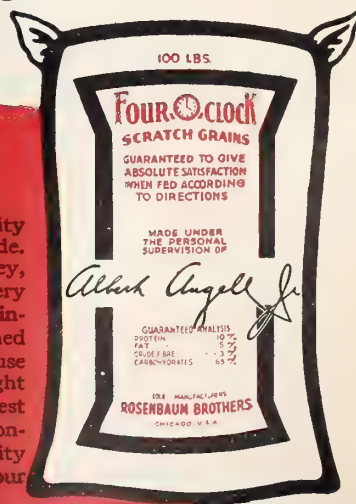

Another advantage of using Vitality feeds is that we do our own experimenting with our own Vitality birds and know "what's what" when it comes to feeding for results.

ROSENBAUM BROTHERS
POULTRY FEED DEPT.
Chicago, U.S.A.

To be fed in place of Vitality Fine Chick Scratch after 4 weeks, and until the birds are large enough to consume the Four-O-Clock Scratch Grains. Made to balance with Vitality Growing Mash. Contains no waste or fillers. Feed in deep litter to induce exercise.

The highest quality scratch grains made. Contains no barley, oats or waste. Every particle of every ingredient is consumed by the fowls, because there is just the right quantity of the best quality. Feed in conjunction with Vitality Egg Mash, at four o'clock.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World
Madison Square Garden
New York, 1920 and 1921

The Greatest Record of All Time

This "Add A Section" Idea Makes a **BIG HIT** With Poultry Raisers

If you are planning hatches of from 220 eggs up to 1760, here is the machine that will just exactly meet your requirements—you can start with one section and add additional sections as you wish—you don't have to spend a lot of money to start—you can begin on just as small or large a scale as you wish, letting your incubator grow with your business.

The **MULTI-DEK** SECTIONAL

Sectional Incubator is the only one of its kind on the market—it was designed especially for the poultryman who wants to let his profits pay for his expanding business.

220 to 1760 Egg Capacity

From one to eight sections, each holding 220 eggs can all be heated with one heater. Each or any section can be operated independent of the others. The Multidek is designed and built correctly for perfect incubation—it will hatch every hatchable egg.

Automatic Egg Turning Tray

is a feature that is a very important one—it means a great saving in labor and insures accuracy in the turning of every egg at proper time.

You Can Have **HOT WATER** or **HOT AIR**

Multidek Sectional Incubators are made so that either hot air or hot water heating can be used—you have your choice. While some prefer hot water, others express a preference for hot air heating. Either one is equally effective—it's simply a question of choice.

We furnish the Multidek—any size you want—from one section up to eight. We ship you the lumber all cut, fitted, marked and ready to put together. Any one can set a section up ready to operate in a few minutes.

For the man who is handy with saw and hammer and would like to save money by building his own Multidek, we will furnish complete set of plans with measurements and complete working plans so that you can build it yourself.

Mail Coupon for Prices and **FREE** Illustrated Folder

Fill out and mail coupon and get free folder telling all about this practical economical incubator. Folder tells how Multidek is made—how it is heated—why it hatches better—also low prices. Write today.

From J. Y. Stimmel, Ohio.

HAPPY NEW YEAR! WON FIRST AND SECOND PRIZE AT CHICAGO on exhibition cock birds. Both were "Aristocrats."

From A. O. Whitehead, Colorado.

"I say as you say, Hurrah for the Aristocrats! I won First, Second, Third on cockerels; First on Dark Hen; First on Cock; First on Dark Pen, and other winnings. The birds from the East fell in where I left off. And believe me, Mr. Holterman, we had some show."

From Cameron Bros., California.

"We have just come back from the Oakland show, where we made seven entries and the Aristocrats surely made them sit up and take notice. We won First Cockerel; Second Hen; First and Third Pullet; First Light Cock; Second Light Cockerel; First Exhibition Pen in the very strongest kind of competition. Judge Russell says our First Pen is the best he has handled since coming west and that the First Pullet is a wonder."

From G. A. Murphy, Michigan.

"Just a line to let you know what the Aristocrats did at Muskegon, at the State show at Lansing, and at West Michigan Fair at Grand Rapids. At Muskegon the Aristocrats won 10 Firsts; 6 Seconds; 4 Thirds and Grand Championship of the show on pen. The judge stated this Aristocrat pen was the best pen of Barred Rocks he had seen in years. At the State Show I won Champion Cock, Champion Light Cockerel, Champion Dark Pullet, Second Hen, and First Pen. At Grand Rapids I landed 5 Firsts, a Special, and a great number of other prizes. THE ARISTOCRATS ARE SURELY PUTTING IT ALL OVER ALL OTHER BARRED ROCKS."

**Aristocrats Win Thousands
of Show Room Prizes**

I WON 3 CUPS against all breeds

"I HAVE WON THIS YEAR THREE CUPS with ARISTOCRATS in three of our biggest shows FOR THE BEST PULLET IN SHOW AGAINST ALL BREEDS," writes P. I. Cloete, from Aliwal North, South Africa, in his letter to me dated June 6, 1922. Mr. Cloete says further, "Although I am one of the younger Barred Rock breeders in this country, still, since I started breeding this strain of Aristocrat Barred Rocks, I am today in the front ranks as a breeder and exhibitor of high-grade birds. At our local show in strong competition I won first, second and third on pullet; first, second and third on cockerel, and first and second on breeding pens."

I quote this letter merely to show you how *Aristocrats*, the world over, sweep everything before them as show birds.

Every Bird a Prize Winner

3 MONEY MAKING TRAITS COMBINED IN EVERY 1

Aristocrats are not only prize winning show birds, but are, in addition, Egg Laying Contest Winners! A world's egg record holder is an Aristocrat fowl! Moreover, every Aristocrat male or female commands the highest price as a market chicken ANYWHERE, ANYTIME! I have official show and egg contest records covering the past ten years and 10,000 signed letters supporting these statements. Every day I receive anywhere from a score to a hundred such letters as this—each telling of another Aristocrat victory, a great percentage of these letters stating that the same bird is a show winner and a great egg layer. They all agree that my birds have come to be called the world over the

WORLD'S FINEST STRAIN OF HOLTERMAN'S "ARISTOCRAT" BARRED OWN ROCK TRIPLE PROFIT FOWLS

You have known champion show birds, egg contest winners, and biggest money market birds! But the only birds ever known to combine ALL THREE of these rare and valuable money making qualities together IN ONE STRAIN of birds are Holterman's ARISTOCRATS—the Triple Profit Fowls. And because I produce them in tremendous quantities under such economic methods as quantity production alone can make possible—that is why I can sell these Greatest Prize—Egg and Market Combination ARISTOCRAT Barred Plymouth Rocks at amazingly reasonable prices and ALL ABSOLUTELY GUARANTEED.

BEST for SHOW--for LAYING--for MARKET

**MAIL THIS
Coupon NOW!**

Read my unequalled guarantee—no other protects you so completely. It convinces you of the actual quality of Aristocrats more than anything I can say:

I hereby guarantee that every Aristocrat sold by me will suit the purchaser in every way. IF FOR ANY REASON THE PURCHASER IS DISSATISFIED, THE BIRDS MAY SIMPLY BE RETURNED IN GOOD CONDITION AFTER A REST OF THREE DAYS AND I WILL THEN GLADLY REFUND THE ENTIRE PURCHASE PRICE. This broad guarantee surely protects you fully. You may well rest assured that under these conditions I will send you birds so rich in quality for the price paid that they will be far beyond your just expectations.

(Signed) W. D. HOLTERMAN.

***I tell you—
the Wishbone is the biggest
money maker I ever bought***

Get the Wishbone Catalog

See for yourself how the Wishbone can make money for you. Read how the remarkable Wishbone tray will save you time and trouble and work—how the Wishbone has been improved to reduce incubation to a few routine duties, as simple as winding a clock. Write for catalog now.

IF I couldn't buy a Wishbone, I'd stop hatching. That Mammoth not only makes the most money but it's a real pleasure to operate. It's the best 'help' I have—it's safer and surer than the human machine—it works twenty-four hours a day and works well!

"I've just finished my hatching season, and I've banked nearly \$15,000 profit. I must say I feel glad to think I had the good sense to buy a Wishbone and refused to be tempted any more by the 'just-as-good' propositions with which I was bombarded.

"I've never had a bad hatch with the Wishbone! **YOU CAN ACTUALLY COUNT YOUR CHICKS BEFORE THEY ARE HATCHED** within three or four per cent. You know what to expect. Isn't a man then awfully foolish to take a chance on new-fangled contraptions when he can get a tried-and-true standard Wishbone? I've tried 'em—'nuf said.

"The Wishbone, you see, almost runs itself. After I've put the eggs on the trays I don't touch 'em again. It's self-regulating.

"What about space?" did you say? Don't make any mistake. In any space the Wishbone provides more egg capacity than any other machine. And say, before you go away, have a talk with my wife. She runs the machine herself when I'm away—handles a 40,000 capacity and still has plenty of time for her housework.

"It's so easy to keep clean. Everything is removable—everything is 'get-at-able'. The turning track you notice is now in the center of the machine—right out of the way at the *back* of each tray. This feature alone makes the Wishbone worth buying.

"The heater's a wonder, too—uses any fuel and only half as much as you'd think.

"Have you seen this new catalog? Just look at these wonderful New Trays on page 5 and the New Temperature Regulators on Page 7. No longer necessary to climb on top of the incubator—any slight adjustment can be made from the front.

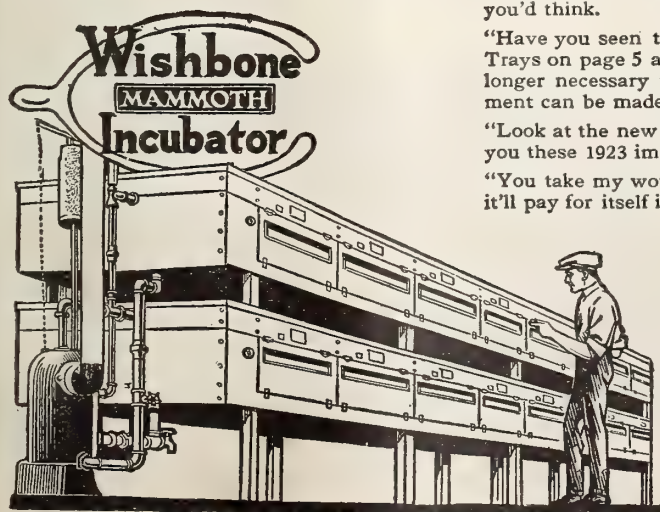

"Look at the new moisture pan with its drain for easy emptying! I tell you these 1923 improvements alone are worth getting excited about.

"You take my word for it—study this catalog—then get a Wishbone—it'll pay for itself in half a season, and it will be the most profitable as well as the most pleasant season you've had."

**The Most Enthusiastic Wishbone
Boosters are Wishbone Users. If You
Know One, Ask Him**

Wishbone's greatest boosters are its users! Every day we trace orders to some user's recommendation. Write us for the name of the Wishbone user nearest you.

Owen Farms

*has stood Pre-Eminent as
a Breeding Establishment
for 17 Years*

During this period more than thirty thousand shipments have been made in the United States, Canada and abroad. Very few really good flocks exist that are not wholly or in part Owen Farms Bloodlines. Leadership over a long span of years has to be won on sheer merit. The established bloodlines at Owen Farms, where careful systematic line-breeding has been followed year after year, has been the big factor in the success attained by the many thousand Owen Farms' customers all over the world.

Owen Farms flocks have been bred to the highest Standard requirements for exhibition. They have been selected and bred in the same careful way for egg production. The wonderful prepotency of Owen Farms birds has enabled them to become dominant wherever they have gone. They have won the highest honors in the Show room and made records of over 300 eggs in 365 days in the trapnest.

Genuine value and "Golden Rule" treatment given every customer have been the basis upon which the permanent success of Owen Farms has been built. Am very proud of the hundreds of customers who come back from time to time when they need help. "One an Owen Farm Customer, Always a Customer of Owen Farmh" has become a truism.

Down To Date Service

is at your disposal here at Owen Farms. Careful records are kept of every shipment, and you can come back at any time and secure the proper bird or birds to nick with those you have and go on with the line-breeding. My records are complete enough to enable me to visualize any birds shipped even though sent out some years ago. What I have learned during twenty-four years devoted to breeding Standardbred poultry is at your disposal. Am always glad to advise my customers, and, in many instances have saved them large sums of money. **Come and visit my farms if you can.** At any rate, come fully and freely on paper and learn for yourself if you awnt to become a member of the large and growing Owen Farms family.

1922 BUSINESS

will be large because the finest cocks, hens, cockerels and pullets ever on Owen Farms are rapidly rounding into shape to meet your requirements. Winning old and young birds for your show; superbly mated pairs, trios, or pens to produce strong sturdy birds that have the ability to lay and pay as well as to win; utility birds of the highest class; you will find them here on Owen Farms at prices you will gladly pay.

Splendid utility cockerels at \$7.50 and \$10.00; choice breeding and show cockerels at \$15.00; \$25.00 and \$35.00; superb exhibition and breeding cockerels at \$50.00; \$75.00 and \$100.00. Utility pullets at \$5.00 each and choicer pullets at \$7.50 to \$50.00, just half the price of the cockerels of the same grade. Choice cocks and hens a matter for correspondence.

Whatever you are needing you will find among the thousands of

How the Poultryman May Know His Hens

IF you would know the most interesting thing about each of your individual hens, that is the number of eggs she lays in a year, you must either trapnest your flock throughout the entire year or must become a careful student of modern poultry culling methods.

While it is generally recognized the trapnest is the most accurate method of determining the laying ability of individual birds, anyone familiar with trapnesting methods knows that some inaccuracies occur even in the trapnest because a considerable number of floor eggs are found in trapnested pens which rightfully belong to some hens that do not get credit for them.

A careful study of the characteristics of good and poor layers as they are taken out of the trapnest day after day has enabled poultry investigators to formulate culling methods which gives the person who has mastered them the ability to form a good estimate of the producing ability of a hen without the labor of trapnesting her.

Out of the Guessing Class

Keen students of culling methods can make remarkably close estimates of the actual trapnest records of laying hens, and anyone who will take the trouble to master a few of the principles of culling can quite accurately separate his hens into three classes: the high producers, the low producers and the medium producers. Even the man who is trapnesting consistently ought to carefully study modern scientific culling methods so that he can check up on his birds and have some notion of which hens are not getting a fair show on the records because they do not lay in the trapnest. Modern culling methods are based upon physical differences between heavy layers and poor layers which can be seen, measured or felt.

By T. S. TOWNSLEY
The hen is covered with sign boards—How to read those signs—No longer necessary to feed hens of low egg capacity—Cull and keep the best layers.

The close observer can pick out the best layers in the average flock by simply taking a good look at the hens. The general appearance of the bird, her activity, size and shape of the head, prominence of the eye, and general body type are good indications of her laying ability. The best producing hens are friendly,

strong, active, healthy, well formed and medium in size, while the poorest producers are likely to be either wild, cross, lazy, weak, overfat, scrawny or ill proportioned. A high producing hen walks like a queen proud of her lineage and can be easily spotted.

What the Head Tells

The heads of the best layers show marked vigorousness coupled with quality and feminine appearance. A good producing hen has a stout, well curved beak, broad head, a bright prominent eye, a red waxy comb and a refined lean appearing face. The poor layers may be either crow headed or have exceedingly coarse heads. The eye is likely to be dull or sunken, the comb pale and the face be lacking in character on the hen that does not lay well.

There is a certain definite body conformation found in a majority of the good producers which can be easily measured by taking the hen in the hand. The heavy layers have good chest development, indicating vigor, which is essential for high egg production, and have a broad, straight, smooth back together with a long keel. The back of the high producing hen conforms very closely to the type of back found on a prize winning beef steer. The hips are well covered with flesh and the rump is wide back of the hips in the good producing hens. In the low record birds the chest is commonly narrow as indicated by a knock-kneed condition and by a sharp prominent

Two White Leghorn hens. Left, poor producer; right, good producer. Above, left, head of poor producer with shriveled comb. Above, center and right, head of good producer with waxy comb, bright eye and smooth face.

backbone. The hips on the low record birds are likely to be prominent and very poorly covered with flesh so that they present a knobby appearance, and the rump of birds of this type is commonly pinched off at the rear to a wedge shaped point.

There is a decided difference in body capacity between the good hens and the poor ones as indicated by the depth from the front of the keel to a point on the backbone directly over the heart girth and as shown by the depth from the end of the keel to a point on the backbone between the hips. The best layers show a deep chest and a depth at the rear that is equal to or greater than the chest measurements, while in the poor producers the abdomen is shallow and the rear end of the keel cuts up to meet the backbone.

Texture of Skin.

There is a noticeable difference in handling quality between a hen that will lay upward of 200 eggs and a bird that produces 100 or less. In the best hens the skin over the breast is soft, oily and pliable, having a texture that resembles the finest chamois, while in the poor birds the skin is likely to be dry, coarse and rough, giving the impression of parchment. The breast and pin bones on good layers will be thin and smooth while on poor producers they are likely to be thick and more or less roughened. The abdomen of the best hens between the end of the keel bone and the pin bones is large, full and expanded but is also soft and pliable. A bird with a small contracted or baggy abdomen is almost never a good producer. The shanks of heavy layers are usually flat with creases down the sides and with scale of fine texture, while poor layers are inclined to show round shanks covered with rather coarse scales.

Physical Condition of Good Layers

There is usually a marked difference in condition between the hen that lays well and the one that lays poorly. Good layers are in medium flesh with the breast well rounded and the abdomen soft and expanded, while the poor hens may be either very thin or over fat as shown by a hard baggy abdomen. It is an easy matter to tell whether or not a hen is laying by the distance apart of pin bones and the pliability of the abdomen, and hens that are out of laying condition at any time except during the natural molting season are usually hens that make a poor laying record. When a bird is laying the ends of the pin bones are likely to be straight and the skin between them

will be loose and pliable so that two large fingers or three medium sized fingers can be easily inserted between the ends of the pin bones. When the hen stops laying the ends of the pin bones come close together and the skin between them is drawn tight.

Some one has said that the hen is literally covered with sign boards that need only to be read to determine her laying ability. One of the signs that is of material benefit in helping to estimate the production of hens during

the fall months is the amount of yellow pigment shown in the shanks, beak, earlobes, eye ring and vent. Prominent yellow pigment in yellow skin birds during the fall months is a good indication of a poor egg record.

Pigmentation.

When a hen lays continuously the yellow color normally present in various feeds is used to color the yolk of the egg, so the pigment in the skin gradually bleaches out. Whenever the hen stops laying the yellow color is diverted from the egg yolk to the skin and the visible body parts gradually resume their deep yellow color. The yellow pigment fades from the vent very quickly after a hen starts laying and is replaced there with-

in a few days after she stops. The eye ring bleaches next after the vent, then the earlobes in white lobed breeds such as Leghorns, followed by the beak and finally the shanks. From four to six weeks of heavy laying is commonly required to entirely eliminate the yellow pigment from the beak and from five to six months or even longer in thick skinned birds is necessary to entirely bleach the shanks. However, a short vacation period will quickly re-color the beak with yellow and give a

decided yellow appearance to the shanks. It is a fairly safe practice to dispose of all birds that show prominent yellow shanks and beak during July and August providing the flock has been well fed during the spring and summer and the hens that show yellow have not been used for hatching and brooding chicks. In studying pigmentation it should be borne in mind that any vacation will cause the shanks and beak to become yellow if the hen is eating green grass or yellow corn, and the hen should not be discarded simply because she shows yellow shanks unless there is no chance that she may have brooded chicks or have been thrown off from egg production by mismanagement.

In systematic culling, the date of molting is one of the important points to consider. The time that the hen molts show whether she is a consistent layer or is a quitter.

Left, poor producer; right, good producer. The rump is wide, back of the hips, in the good producing hen.

Left, poor producer; right, good producer. The good producer has a bigger barrel and larger intestinal capacity when you span her body with your hand from hip bone to end of keel bone back of legs.

The time of molting is another signboard that helps materially in estimating the production of individual hens. The time that a hen molts shows whether she is a persistent layer or a quitter. When she molts she has usually finished her laying season. A good producer keeps on laying late into the fall until the approaching winter forces her to stop and renew her coat of feathers. The poor producer exhausts her laying energy in the spring and starts molting in July, August or September. She has a greatly shortened laying season but prolongs her molting period throughout several months. The early molter sheds slowly while the late molter sheds quickly.

In the opinion of most poultry keepers the early molter is a poor layer. In handling hens it is easy to determine the condition of molt. If the molt has started some feathers will be missing and the soft, tender pin feathers will show where new feathers are coming in. If the molt is complete the coat of feathers will be clean, fluffy and in an excellent condition. If the molt is not started the coat is likely to be dirty and ragged and the ends of the wing and tail feathers be worn and broken. In many cases a hen will undergo a partial molt due to unfavorable conditions but will later recover and resume laying. In order to be certain that the molt is general rather than partial, the wing should be examined and the condition of the primary feathers be noted. A close student of culling can estimate fairly accurately how long a hen has been molting by the number and length of the new feathers in the primaries. The primary feather next to the axial feather drops when the body molt starts and about six weeks are required for it to grow to full length. As a rule the next feather is dropped within about two weeks and an interval of something like two weeks intervenes between the dropping of each succeeding primary. In some cases, however, the primaries are dropped in clips of two, three or even four at a time and only two weeks intervenes between the dropping of each clip.

By carefully studying the general appearance, shape of the head and eye, the body conformation, the handling quality, the condition, the pigmentation and feathering of the hen, it is possible to learn to estimate with reasonable accuracy the actual trapnest record of birds. Most college courses in poultry husbandry include instruction in

utility judging and the performance of the student judging teams at the Chicago poultry shows have shown that considerable ability in estimating records can be attained.

The matter of score cards for utility judging is one that is receiving considerable attention at the present time. A number of utility score cards have been proposed but probably considerably more study on the subject will be required before a truly scientific one is devised. The utility score card was recently tried out in connection with the district judging schools for county agents in Missouri and it was found that by careful scoring the estimated records on five hens would vary less than 20 eggs from the actual trapnest record of each bird. See page 866 for reproduction of this utility score card.

Systematic culling to get rid of the loafer hen is a new art that rapidly is becoming an established farm practice. Poultry keepers long have felt the need of some satisfactory method of detecting the drones in the flock, because the hen that always has her crop full and seldom lays is not a very profitable investment.

Reports from 2,268 farm flocks in the State of Missouri which were culled, show that out of a total of 228,000 hens handled 81,000 were rejected as

culls. In some of these flocks the number of culls ran as high as 50 per cent of the flock, and the average for all showed that thirty-five hens out of each 100 were not worth keeping.

Time to Cull

Since the object in culling is to get rid of the loafers, the proper time to cull is at the beginning of the loafing season. It should be understood that there are very few hens which never lay. Practically every hen, unless in some way deformed, lays during the spring and early summer. There would be no object in culling during March, April or May, since nearly every hen is laying at that

time. Egg production drops off rapidly during July, August and September, and remains at a low ebb during the winter months. Trapnest records show that hens which make a poor showing for the year lay most of their eggs in the spring and then loaf throughout the other months. Many hens stop laying in July or August and will not lay until after Christmas. These are the birds that should be gotten rid of at culling time. (Continued on page 864)

What the Market Demands In Poultry Breeds

DURING the past few years there has been much interest and activity toward the development of a more satisfactory method of marketing agricultural products—more satisfactory from the standpoint of the producer—and poultry is naturally receiving its attention along with the rest.

Special attention has been given to shortening the route from producer to consumer; attempts have been made to lessen the spread in prices between the producer and the consumer; and some hope, in fact some attempts, at least on the part of the few extremists, of entirely wiping the so-called middleman off the map and selling direct from producer to consumer can not be denied.

A great day this is in which we are living, when seemingly every integral part of every important industry is working and striving for the particular position it most desires to occupy when we can say that conditions have settled—after the readjustment.

Should this great agrarian crusade suddenly subside, and time were taken to reflect, one might assume that one of the prime fundamentals of marketing—what the market demands—had been overlooked. Therefore, I undertook to make a careful study of what the market demands in poultry and eggs; and unless the producers are so informed along these lines, the assumption would practically be correct; so let us be informed.

The following letters were received from some of the largest and most reputable receivers and sellers of live and dressed poultry on both the Chicago and New York markets. They bear out in a very vivid way the actual facts concerning what the market demands in poultry.

By Edw. F. Murphy

The author, head of the Poultry Marketing Work of the Illinois Agricultural Association, makes inquiry of the type of live poultry the market requires.

the best producers, although we have seen figures from some of the experiment stations, which would dispute this fact."

July 10, 1922.

"Dear Sir:

"Your favor of the 5th received and in answer will say the breeds of chickens in most demand in the markets are the Plymouth Rock, Wyandotte and Rhode Island Red. There are of course, other breeds

of almost as good quality, but more prejudice is being developed each year against the Leghorns, principally on account of the size of the Leghorn fowls and on account of the young Leghorn roosters commencing to get staggy when they weigh around 2½ to 3 lbs.

"It seems the hotels, restaurants and steamship lines are the largest consumers of dressed poultry, in New York, for instance, and they really make the market. They require large fowls 4½ lbs. and over dressed, and the smaller fowls are bringing lower prices relatively this year than in the past.

"Will enclose you a New York circular by which you will see that 2½-3 lb. fowl are 8c per pound under 5 lb. fowl, and 3-3½ lb. fowl are 7c per pound under 5lb. fowl."

"July 7, 1922.

"Dear Mr. Murphy:

"Answering your letter of July 5th in the matter of what breed of chickens has the most ready sale, beg to advise that my investigation discloses that Barred Plymouth Rocks in good condition meet with the most ready sale—in fact, it requires no salesmanship to sell them, and under ordinary conditions they sell themselves. The next greatest demand is for Rhode Island Reds and White Rocks; after these various other breeds such as White Wyandottes, etc.

"Concerning Leghorns, Anconas, Black Spanish and in fact all classes of light weight poultry, have to advise there are market discriminations during most seasons of the year, this discrimination however, does not mean that these breeds, particularly Brown and White Leghorns are not in demand on the large markets. As a matter of fact they are in demand, but will not command the prices obtained for other classes of chickens and for this reason they are classified as 'Leghorns.'

"In the sale of 'chickens,' purchasers, according to the customs of the trade, understand that the breeds mentioned will not be included in the deliveries. If the deliveries should contain these breeds, then they will be returned to the seller or a proper price adjustment will be made by agreement. Price discriminations are also made against Black Minorcas and black feathered and black legged breeds because they do not dress well for the table. Where the breeds which are discriminated against are included in a delivery, adjustments are also made.

"I am told that a delivery which contains a very small quantity of the small breeds or black varieties will usually 'go thru' if in good condition, and when the market prices will permit. When such prices are included in deliveries it is usually done by the seller in his zeal to protect the shipper. I am told also, that buyers are becoming more discriminating than ever, and for shippers to save themselves trouble and controversies in this regard, that it would be to their interest to buy on a quality basis, paying the difference in price between the breeds mentioned and other chickens, and to apply the same discrimination at buying time that sellers or commission merchants have applied against them at the selling time.

"I would say that as a general proposition, the discrimination in prices against the Leghorns and smaller breeds is as great as from four to six cents per pound, depending entirely upon market conditions and the season of the year.

"I believe you could perform no greater service for your poultry raisers than to advise them of this discrimination."

Premium for White Eggs.

The New York market has paid a premium for chalk-white eggs that averaged 24 ounces per dozen. A careful survey the past year shows that this premium has had its effect in producing a large supply of Leghorn fowls on corn belt farms. The central states have been somewhat Leghornized, but consumers in New York have begun to realize that there is no difference between the interior quality of a white shelled egg and a brown shelled egg, the only difference being merely in the color of the shell.

"Dear Mr. Murphy:

July 26, 1922.

"Replying to your communication of the 5th, relative to the kinds of fowls the market demands would say that heavy breeds have the preference over light ones and the best sellers are Barred Plymouth Rocks, White Rocks and Rhode Island Reds, in the order in which they are given.

"These birds weigh from four to eight pounds and heavy fowls like these are always wanted by the Jewish and Gentile trade. Occasionally there are times, when because of high prices of fowls, small but plump hens will sell reasonably well but it is only for a short period. In the flush of the season when receipts are heaviest light and heavy hens are sorted and the spread in prices is about 6c per pound.

"Leghorns come in as light hens and are therefore discriminated against accordingly. Leghorn hens besides being small are of a rather nervous temperament and when cooped up will, on the slightest noise being made, run from one end of the coop to the other. Heavier birds do not seem to be so easily affected and the result is that when leghorns are dressed out they have a blue appearance and when cooked the meat appears to be tough and stringy."

* * *

July 7, 1922.

"Dear Sir:

"The poultry trade has always had an objection to both the White Leghorn fowl and the White Leghorn chicken. It seems that they are not readily sold to the Hebrew trade, unless they are sold at a great sacrifice in price.

"It is especially requested that if you ship any white fowls in cars that these white fowls be kept in separate layers. To mix thru a car, say ten layers of white fowls, would depreciate in value the balance at from one to two cents per pound."

* * *

July 6, 1922.

"Dear Sir:

"Referring to your letter of the 5th. We find that the poultry being most desirable for marketing purposes are the ones that will weigh when matured from 4 to 6 lbs. per bird and find that the best general results have been obtained mostly from such birds as Plymouth Rocks, Rhode Island Reds, Orpingtons and possibly Wyandottes. Another feature to be considered is the color of plumage. We find that black birds or mixed birds as a rule show a considerable quantity of pin feathers when dressed which give the poultry a bad appearance.

"The objection to Leghorn fowls is that they are altogether too small, as people desiring fowl for food purposes, want something that will weigh 4 lbs. and up, as this class of poultry is used mostly for fricassee or for slicing for sandwich purposes or for salad.

"We find that this year the poultry dressers, not only in the country, but in the large cities, are quoting a differential in buying their poultry, paying smaller price for the Leghorn breed.

"Some people also claim that the regular Leghorns after they have matured are not as soft meat as the larger sizes.

"We understand that from laying standpoint, Leghorns are possibly

Typical Leghorns in Rich Golden Buff

ALMOST anyone who knows what domestic poultry is knows White Leghorns and Brown Leghorns by sight. They are everywhere, scattered over the United States, in large flocks on commercial farms, in smaller flocks on general farms, and in still smaller flocks in backyards and city lots. In short, they are almost universally known in the United States. But breeders of Buff Leghorns often hear their birds variously designated "Buff Cochins," or "Rhode Island Reds," or even "Brown Leghorns." There is a prevailing ignorance of what the Buff Leghorn is, and it is to provide enlightenment on this subject that this article is written.

We wish to state at the outset that we have no desire to advocate Buff Leghorns to the detriment of other equally worthy varieties. We simply wish to let the world know what we have in "Buff Leghorns," and to provide some information on the history, present status, and qualities of this truly valuable variety.

Origin

We are accustomed to think of the Leghorn as an Italian breed and rightly so. And yet, although in all probability all original pure Leghorn stock, of whatever color, came from Italy, the modern American Buff Leghorn has a very variegated geographical history back of it. Let us, then, assume that the original Leghorn stock came from Italy. This stock was in Denmark (and probably elsewhere as well) developed to a sort of yellow color that could not be called buff, and yet that certainly was neither white nor brown. In England these were made into a truly buff Leghorn, and in the United States has been produced from this English-Danish stock the Buff Leghorn described and illustrated in the 1915 American Standard of Perfection.

Information is not available as to the approximate date when "yellow" Leghorns were first bred in Denmark, Italy, or elsewhere. Possibly it was back in the middle ages. But at any rate we find in the eighties two English breeders, Mr. and Mrs. Lister Kay, of East Close, Christchurch, Hants, England, looking for a Buff Leghorn. After searching in vain for some time they finally secured six birds ("yellow" Leghorns) from a Danish breeder, a certain Heinrich Johansen. Part of this importation was so poor in type and color that it was immediately discarded. The rest was used as stock from which to produce a Buff Leghorn. Buff Cochin blood was introduced, and then the Cochin characteristics carefully bred out. The result was, in a very crude form, a bird of Leghorn type and buff color. The type was of course the very coarse Leghorn type that was prevalent in England at the time (and still is). The birds were imported from Denmark in the latter part of the eighties. We know that even exhibition Leghorns in England look extremely coarse to us when compared with our Standard Leghorns. We often enough see in the United States "English" Leghorns. The reader can easily imagine that the original Buff Leghorns were none too good in either type or color when

By J. G. VOS

**How to mate Buff Leghorns—
Origin of this variety—Condition-
ing for the show room—Defects
to guard against.**

judged by our modern Standards. Probably they were rather squirrel-tailed, with huge, over-sized combs and wattles.

In the year 1890 Mr. A. D. Arnold, a Pennsylvania breeder, imported some stock of Mr. Kay. The birds that constituted this importation contained 25 per cent of Cochin blood and 75 per cent of Danish "yellow" Leghorn blood. This importation, together with others concerning which information is not available, constitute the foundation upon which was built the variety as we know it today. The new variety was known as the Buff Leghorn, was single combed, and similar in type with other varieties of Leghorns. The variety made considerable progress and was soon taken up by many breeders and fanciers. As early as 1895, less than ten years after their origin, they were admitted to the American Standard of Perfection by the American Poultry Association. A rose comb variety was later admitted, but has not made great progress, although it is being bred by a number of breeders at the present time.

Present Status in the United States

Today, while the Buff Leghorn is by no means as widely known as the White Leghorn and the Brown Leghorn, it is very well distributed over the United States and to a certain extent over Canada. The variety is not bred commercially, that is, on egg farms, to any great extent. It is found on a great many general farms and in a very great many backyards, where it is kept solely for practical purposes. Besides this, the variety is kept by a great many fanciers all over the country, some on farms, and some in towns and cities. There is an association, I believe, between two and three hundred members, and is at present having its difficulties.

The Buff Leghorn as a Practical Bird

As stated above, the importance of Buff Leghorns in commercialized egg production is not great. Quite probably it amounts to just about nothing. But let no one suppose that this is because Buff Leghorns are not profitable for egg production. The fact that they are not used largely on commercial egg farms is due to quite another reason, as we shall soon see. They are not found often on large egg farms for essentially the same reason that Anconas, Brown Leghorns, Black Leghorns, or Campines are not found on commercial egg farms to any great extent. The egg farms prefer a white bird, so that they can rear thousands and hundreds of thousands without giving consideration to color in their matings.

On general farms the story is quite different. Buff Leghorns are found on a very great many general farms, where they have taken the place of that almost national disgrace, the mongrel flock of chickens. Where two or three hundred or less chickens are kept, the preference for a white bird on account of color ordinarily does not exist. A buff or brown or striped or speckled bird will do as well. And so, the Buff Leghorn has come in for its share of farm flock breeding along with other (Continued on page 860)

Report of the Convention of The American Poultry Association

By FRANK L. PLATT

In words of welcome to the American Poultry Association, assembled for its forty-seventh annual convention, in beautiful Chilhowee Park, Knoxville, Tennessee, Professor H. A. Morgan of the University of Tennessee, said:

THE invisible gates of neighborly Knoxville swing open to the poultry breeders of America, and we bid you welcome. We are glad to have you here. We believe that your meeting here in the Southland will prove to be a help and inspiration to us. We of the South are on the verge of a great agricultural readjustment. Cotton has been our major crop, and cotton has carried our agricultural efforts to the markets of the world. But times and conditions are changing and we are going to have more diversified farming in which poultry and eggs will play a relatively important part.

"Ladies and Gentlemen, I welcome you to Knoxville and to Tennessee, and with all my heart I welcome you to Dixie. Here between the mountains is a valley, a beautiful valley, and here in this Imperial Valley of Eastern Tennessee, we of the South have planned your annual meeting. I mention this because I want you to get the setting, the right atmosphere for your work. I want you to taste the glory of the Southland this week.

"Our poultry interests in the South are tremendous, and the purebred fowl of your making and your breeding is the source of our hope that the farms of the South may be stocked with efficient hen machines. It is my hope that this week you may adopt for those many and wonderful breeds the best Standards ever written in the history of purebred poultry in America.

"Now, Mr. President of the American Poultry Association, in behalf of the Mayor of Knoxville, I present to you and to the American Poultry Association this Key to the City of Knoxville."

(Applause)

President Rigg replied appropriately to the warm and cordial words of welcome and accepted the huge key to which was tied a sheet of silken ribbon with an inscription printed on it. From that hour the proverbial hospitality of the South became more and more a personal reality to each and every member of the Association.

The sessions of the Convention were held in a

building that was devoted exclusively to the use of the A. P. A. The park lay on the edge of the City, and there in a grove, overlooking a beautiful lake, the meetings were held, undisturbed by the tumult of a downtown hotel. At noon, each day, luncheon was served in this poultry building. The luncheons were free to every member and visitor of the Association. Wednesday afternoon the ladies of Knoxville took all the visiting ladies on an automobile tour of Knoxville and its environs. As some of the ladies were interested in the admission of the Rhode Island Whites, the consideration of this breed was postponed by mutual agreement until the following day. On Thursday evening a banquet of perhaps

three hundred plates, was given in the rooms of the Knoxville Chamber of Commerce. But still thinking that perhaps they had not done enough, R. R. Stripling, chairman of the entertainment committee, on the final evening of the convention, took a large party of guests to Whittle Springs Hotel, five miles from Knoxville, situated in a fairland of hills and valleys, forests, meadows, and farm lands. After dinner was served, the autos were driven up, loaded and started for the home of Captain A. Gaines. Captain Gaines was spending the summer at Buzzard's Bay, Massa-

Stripling, Chairman Entertainment Committee; F. H. McCrae, Jr., Capt. A. Gaines, C. H. Moch, members of Knoxville Entertainment Committee.

chusetts, but he returned home to Knoxville to be on hand to greet the convention. His palatial home is located on a hill overlooking a bend in the Tennessee River, and there, swept by breezes from the Smoky Mountains of Eastern Tennessee, the last of the guests saw the end of a perfect week.

All in all, the A. P. A. convention in Knoxville was a rich experience for all whose privilege and pleasure it was to be in attendance, an experience that will age in the wood and grow more mellow and sweeter as the months and the years roll on. No visiting member came away empty handed. All were loaded with memories of human kindness, generosity and hospitality. They tasted, as Professor Morgan in his address of welcome bid them, the glories of the Southland.

Standard Revision

The meeting at Knoxville was of extraordinary importance because the Standard of Perfection, a book which is the exclusive property of the A. P. A., and which is the official guide in awarding all prizes in the show room, was under revision. A revision of the Standard takes place only once in eight years. The Knoxville convention completed the work brought before it in connection with this revision, and did not alter the resolution passed at the Seattle convention last year to the effect that the 1923 Standard should be printed and available by January 1, 1923, so that all breeders might have

the new edition before making their matings next year. The Standard will then be effective and in full force for the show season starting in the fall of 1923. Professor Arthur C. Smith, editor of the present 1915 edition, was appointed editor of the 1923 edition, and he stated that he would take a month's vacation, beginning immediately, and put the final touches on the work of the Standard Revision Committee and the Convention. Arthur O. Schilling had completed all the new Standard illustrations, and these were approved by the Revision Committee and the convention with a few slight alterations which he will make immediately.

The Standard Revision Committee met four days in advance of the convention, and held sessions morning, afternoon and evening. These were open sessions, as at Chicago, and every breeder in attendance had full liberty to express any opinion and discuss any matter before the committee. A large volume of correspondence had been received by Chairman E. C. Branch, following the publication of the Standard Committee's recommendations as voted on at the Chicago meeting last March. The committee was more interested in suggestions and criticisms from breeders than in compliments, although the latter were not lacking. As a result of this studious effort to represent no personal or selfish interests, but to gauge every action by the good it would do the breeds, that the integrity of the Standard might be preserved and the dignity and majesty of the pure- (Continued on page 882)

Editorial

Breed Popularity

It doesn't pay to simply be in the business of knocking the Leghorn. The "Egg and Poultry World" tried that. They began their tirade against the Leghorn in Volume 1, Number 1, and after four issues "the financial end of the publication proved to be very unsatisfactory and those who were backing it, quit it cold with a loss of \$581 on the first four numbers."

The man who stops to dig holes for someone else to fall into, isn't going to have much time and energy left to put into earning power for himself. He is bound to fail.

As we understand the motive of E. F. Murphy, author of the article in this issue on "What the Market Demands in Poultry Breeds," Mr. Murphy started out to find out, as a matter of information, what are the important objections to the Leghorn as a practical market fowl. Research of this kind is always serviceable.

Mr. Murphy is head of the Poultry and Egg Marketing Division of the Illinois Agricultural Association, an organization composed of a hundred thousand Illinois farmers. It is desirable and important that he should inquire into market conditions, should learn what types of poultry are most satisfactory as market fowls, and take note of the prejudices of the buying trade.

In New York, buyers pay a premium for white egg shells, although they do not eat the shells. In the west buyers are very evidently "down" on the Leghorn, a condition that is based partly on prejudice and partly on fact. We producers might as well concede that "notions" sway the market, that the market is not all a commercial utility proposition.

Notwithstanding the opposition, the Leghorn, by which we mean to include its allied breed, the Ancona, is having the greatest boom enjoyed by any race of domesticated fowls in recent years.

When is a breed going forward? Not when the classes in the shows are largest. Not when a specialty club is exploiting it. It is most unquestionably going forward when it is going into the hands of thousands of new breeders, and covering the farms of the nation. Then is a breed enjoying that solid prosperity that will be reflected sooner or later, throughout every agency of the poultry industry.

It is in this sense of wide and ever wider distribution of the breed, and in the increase in numbers bred, that the Leghorn has been having the greatest run of popularity ever enjoyed by any breed. There are sections of the country that are snow-flecked with White Leghorns. One big hatchery that produced five thousand baby chicks a day the past season, found that of the ten breeds of chicks it sold, two-fifths were White Leghorns. In the vicinity of Holland and Zeeland, Michigan, there are about forty hatcheries, and they all virtually specialize in White Leghorns. The question of "Breed popularity—of what does it consist," could be answered by saying: When the breed is used to stock so many farms and proves so satisfactory for its purpose as the White Leghorn.

The fanciers do not deserve credit for the popularity of the Leghorn. The White Leghorn specialty club has only been brought to life the past few years, and Arthur Schilling recently stated: "I am satisfied there are fewer real White Leghorns in the country today than ten years ago." Leghorn popularity is based on the economic fitness of the breed as a commercial egg proposition. It is nearest to a fool-proof egg type, it is an economical consumer of feed, and the birds of the White variety are so tame, rugged and fast to mature that they lend themselves readily to machine methods of rearing.

Economic conditions, more than anything else, swing the pendulum of breed popularity. For several years egg production has been undergoing great development. It has followed that the breeds best adapted for egg farming have greatly increased in popularity.

Alexis L. Clark, Chief, Bureau of Markets, Dept. of Agriculture, State of New Jersey, has sent a circular letter to various State agricultural agencies, from which we quote:

"For something over ten years now, most of the educational and promotion forces have been directed toward the egg production end of the poultry business and a truly wonderful development has taken place. The growth in popularity of the White Leghorn breed of poultry and the tendency to substitute egg producing varieties in the place of general purpose and heavier breeds has been noted in most sections of the country and particularly so in certain states. Trade papers and dressed poultry dealers have called special attention to this condition in the past year or two and it may be more than likely that the greatest opportunity for developing the poultry industry from now on lies in the dressed meat end. It is certain that market demands reflected in prevailing prices are holding very strong.

The statement will probably not be disputed that the poultry industry needs all around development. Perhaps nothing will stimulate the American poultry industry today as the production of high class, dressed poultry."

Harry Wolsieffer, poultry editor of "The Philadelphia Record," who is in touch with eastern market conditions, contributes the following comment on the same subject:

"Exceptional poultry of quality is rare and offers a good opportunity to the poultryman who will cater to this class. Especially in this zone, the poultrykeepers cater to the egg trade, and the lighter breeds are kept. Leghorns largely, when the white egg shell market is catered to, and this brings into market fowls that, no matter what their advocates may claim for them as a meat proposition, do not meet the favor of the housewife; and the consumer is the one who counts."

We are pleased to present these comments by men who are in a position to know. There has been too little frankness in the discussion of breeds and breed popularity. We need to know something more than, "They make a beautiful appearance when on a green lawn." Accordingly, we thank Mr. Murphy for making available to our readers the results of his study of market prejudices and requirements, and we beg the indulgence of breeders of all breeds for having reminded them once again that permanent breed popularity rests upon economic fitness, and that the public needs more facts and figures, and less argument and glowing generalities about each breed being "the best breed." "There aint no such animal" as a chicken that combines all the good of all the others.

Internal Capacity

The matter of introducing production classes into the show room, and inserting a so-called utility chapter into the Standard of Perfection, was not mentioned on the floor of the American Poultry Association convention at Knoxville, Aug. 8 to 12. Breeders from all over the country were in attendance, determined to preserve the integrity of the Standard, and rededicate the A. P. A. to the thing for which it was organized, namely, Standardbred poultry. It should not be assumed that the meeting was reactionary. Distinct progress was made along the line of making the Standard exhibition fowl the most useful and productive possible. Action of far reaching importance was taken, and those who patiently read this editorial will learn now of facts which the publication of the 1923 Standard will ultimately and inevitably force upon their attention.

We have been steadfast in our opposition to "Production classes" in the show room, believing it was wrong to set up a "utility class" which the interested public would inevitably assume to be in opposition and contrast to the

"fancy class." We have maintained that there should be one class, and that it should be composed of Standard exhibition birds. This does not imply that the Standard exhibition bird should be merely "fuss and feathers." It must combine the most useful and productive qualities of the breed.

It is not necessary, in judging this Standard exhibition class, that late molting and faded shanks should be considered. These two factors are dependent upon feed and management. They have nothing to do with breed character. When Harry Lamon made the breed on the Government farm, which the U. S. Secretary of Agriculture named in his honor, he selected for white plumage and yellow shanks. His job was to establish breed characteristics. The Standard which is to guide breeders and judges in perpetuating that breed, must call for white plumage and yellow shanks. Those practical poultrymen who employ the breed may adopt and apply the latest knowledge of molting and culling, just as they may adopt the latest and most modern systems of feeding, housing and rearing, but underlying the breed, the foundation of Standard excellence, must be the fundamentals of breed character. Of this the Standard should deal—and judges should place their awards on the basis of breed quality.

What is "breed quality?" In the past breeders and judges have said: "Size, and shape, and color." But that is not all in the light of advancing knowledge. It is being driven home to every breeder of poultry that a chicken is made up of bone, flesh and feathers, three things. The parts are not all external; there is a new set of wonders within, and a harmony of all these parts is necessary to produce a highly efficient animal machine.

Sheep men realized this long ago. They have in their sheep an animal that has been given a woolly protection by nature. The exhibitor of sheep can trim that wool to give his show animal the conformation that he desires. But the good sheep judge is not deceived. He puts his hands on the animal and feels the body underneath its outward covering.

Chickens are another species that are largely dependant upon their outward covering for their shape outlines. Their plumage is often deceptive of the actual body shape. In years past judges have paid no attention to this fact, for there was no knowledge of what significance this or that shaped body really had. Today the situation is different. The relation of body shape to productive capacity is established.

Poultrymen are anxious to learn what the correlation is between body shape and productive capacity. At the two weeks school held at Cornell University, July, 1922, there was a registration of 105 men and women from 18 states. Four years ago, at the school of 1918, there were 43 students. This indicates the increasing number of poultrymen who are anxious to learn, at some sacrifice of time and money, how to judge body capacity.

The knowledge is practical and workable. It certainly is. Take as an illustration the egg laying contest now being conducted by the Connecticut Agricultural College. Beginning November 1, 1921, and up to July 17, 1922, only 15 pens of ten birds each, out of the 100 pens entered, had laid under 1,000 eggs. That indicates very plainly that there must be some practical way of picking out birds of good production capacity. It is useless to say it is all "breeding." Every real breeder knows that breeding in the hands of one hundred different contestants will not produce 85 per cent of the pens—850 birds out of 1,000—that are right up in the running. It is selection of very likely birds from a large number on a hundred different home plants, all of which had breeding, as far as breeding goes.

This judging of a bird's capacity by looking at it, and feeling its body shape in your hands, is a comparatively new method that is being accepted as an established doctrine in poultry practice. Professor T. S. Townsley, in this issue, sets forth the details of this modern system of judging body type. Those who will read and digest his article will derive almost as much knowledge on selecting good from poor layers as though they were to attend a demonstration on culling at an agricultural college.

Breeders are injecting these "handling" methods into their work of mating. Those two great Rhode Island Red breeders of the East, Maurice F. Delano and Harold Tompkins, have been doing so for the past four seasons.

W. H. Card, Secretary of the Rhode Island Red Club of America, sent a questionnaire to members, and of 368 replies received, 7 bred solely for utility, 40 bred solely for fancy, and 321 bred for meat, egg capacity and Standard exhibition quality combined.

How do they breed for these utility qualities? Only 10 trap nest, and only 13 have entered birds in egg laying competitions. The great majority must proceed on the basis of judging productive capacity by the shape of the body.

A chicken has two shapes. One is typical shape, that outline which is largely dependent upon the lay of the plumage, its length and character. The other is body shape, that under-the-surface shape that is judged by handling. It is remarkable how that body shape may vary from the typical shape. A bird may appear rather broad across the saddle, but when you put your hand along the sides of the back and over the stern you find that back tapers in like a flat iron. A Dorking male or female may taper as decidedly as a Cornish. In the illustration on page 843 the back that tapers is shown along side of the back that carries its breadth all the way back. It is this broad back with straight sides that is desired in the layer.

Some of Hogan's measurements are more or less elastic, depending on the time of year and the condition of the bird, but good back shape can be applied at any time of year, in any breed, to birds of any age and either sex. There is something basic in this shape.

The X-ray illustration on the next page, showing the three sections of a hen, feathers, flesh and bones, provides an interesting study along these lines of body type—a study as wonderful in what it reveals as the inside works of a watch. Figure D shows the hip bones. From D to E, the sides of the body should be straight and not pinched in.

Figure B indicates the pelvic or pin bones. Hogan says they should be thin. If the pullet is fat, before the flush of laying, as she should be to overcome the possibility of a fall molt or an early wearing out from laying, the pin bones will be rather fat, not very thin. Get breadth from the hips back, and the pin bones will be a secondary consideration. Some utility breeders are getting \$75.00 for good back shape alone. It is important. But, remember this: It is a back shape that is determined by handling.

Hogan says the distance from A and B should be big. In this he made a great discovery. The abdominal capacity should be large so that there may be big intestinal development. The good layer has big intestines for the digestion and assimilation of large quantities of feed. The intestines of the good layer are twice as big around as the intestinal tubes of the poor layer. It is important that there should be a big barrel, big capacity, to hold this big intestinal development. It is equally as important as a big udder on a milch cow and big mammary veins running to that udder. Hogan conferred a great boon on poultry men in pointing out the relation of large intestinal capacity to heavy egg production, but his system of securing the measurement is faulty.

If you Hoganize strictly by the measurement between A and B, you give the preference to shorter and shorter keel bones. This keel bone which runs from C to A is the hammock which supports the inside organs and holds them up. It is neither necessary nor desirable that it should be a short bone. The fact is that it should be long enough to hold up the abdomen in good form, so that the abdominal pouch will not get baggy behind. The shorter the keel bone, the greater the distance will be from A to B, and the longer the keel bone the shorter the distance will be from A to B. Therefore, in order not to give the preference to birds with short breast or keel bones, the modern system of judging production capacity requires that the measurement shall be taken from D to A. Place the thumb on the hip bone at D and span the side of the body by placing the index finger on the keel bone, back of the legs, at A. That span of the body will give you the size of the barrel without giving

"LADY JANE"—Record 262 eggs in 11 months—
American Egg Laying Contest, 1919.

REGALS

"The Ideal Fowl"

REGAL DORCAS White Wyandottes

have stood the test and may rightly be named the All-Purpose fowl. They are splendid layers of large brown eggs and have made wonderful records in the Official Laying Contests. They are a superb table fowl and mature much sooner than most other strains. Canadian winters are severe but the Regals thrive and keep right on laying with the mercury 20 to 30 below. I raise, as a rule, between one and two thousand January and February chicks with practically no losses.

As an Exhibition fowl the Regals lead all others. No strain has a greater record of winnings. My unbroken record of fifteen victories at the New York State Fair has not been equalled by any other strain.

WHY SEEK FURTHER? If you are thinking of starting in the Poultry Business your success or failure will largely depend on your choice of a breed. If you are already breeding White Wyandottes and are not satisfied with your flock, give the Regals a trial. They have made money for me and they will do the same for you. Book your order at once to make sure of delivery when you want them. 200 acres devoted to White Wyandottes. Free—Send for 20-Page Catalog and Summer Sale List, giving description of over 1,000 breeders that I am offering for sale.

JOHN S. MARTIN

Box 51 PORT DOVER, ONT., CANADA

preference to short keeled birds. The best formed birds do not have a short keel. In males particularly, some of the best ones have a long keel, generally curved, which means that the abdomen of a good male may be small rather than large. This statement is in line with the most recent studies and investigations of the poultry experiment stations of several of the states leading in this line of investigational work.

In Leghorns, the barrel should be deep from the shoulders to Figure C, but in the dual-purpose breeds this is a highly debatable point. In a strictly egg breed the breast bone, "C," is rather prominent. In a typical meat breed the bone is flatter, allowing the breast on each side to be well fleshed and plump, and covering the breast bone from prominence. At this stage of judging body type it would appear desirable not to insist on "C" being deep and prominent in the dual-purpose breeds and most certainly not so in a special meat breed such as the Cornish.

Figure F points to the head. The Standard Committee reduced the value of the comb in a number of breeds. There are other more important sections of the head. A bright eye, free from over-hanging eye lids; a round skull, free from projecting skull; and a smooth face, free from wrinkles or coarseness, are important considerations in an egg or dual-purpose breed.

Descriptions of strong heads, bright, round eyes that are indicative of vigor, straight legs and toes, etc., have been a part of the standard text these many years. There is nothing novel or new about these particular points, and they have long been established as having practical value.

There are some new points such as changes in comb, fading of pigmentation in shanks, beak and vent, loss of fat due to laying, molting, etc. They are of value in culling practice and Professor Townsley covers them in his article in this issue. Feed and management have a direct bearing on them. In dealing with these interesting features, which may be applicable in culling, the A. P. A. at Knoxville took the position that they had no bearing on the fundamentals of breed type, and that birds might be culled on the basis of pigmentation and molting but should be judged on the basis of breed character. Culling was not confused with judging, and the 1923 standard will contain nothing on the subject of culling.

The action of the Knoxville convention was to meet the question, as put by Robert H. Renshaw, Maryland, who interrogates us in a recent letter, as follows:

"As I understand it, the standard is for the exhibitor and a bird may be right up to standard, as far as being a show bird, and yet be very little good from a productive or commercial view. Am I right in this?"

Mr. Renshaw breeds Leghorns, and there was a possibility under all standards up to this time, that the Leghorn with nice contour lines might be deficient in body type. There was nothing in the standard to prevent the high-class standard exhibition Leghorn from being a good layer, but there was no assurance that it would be a good layer.

The 1923 standard will provide that birds shall be judged for body shape as well as typical shape. When the standard back description of a breed reads, "broad, with the width carried well back to tail," the judge will be instructed to interpret this as meaning that the carcass should actually carry the desired width all the way

to the stern, and a bird that pinches in from his hip bones to stern will be adjudged equally as faulty as one that pinches in across saddle or cushion.

This means that a White Leghorn that looks wide (like a certain cock at New York which was sold at a long price several years ago) will be handled for breadth

The External is not all. There is a new set of wonders within.

of back, and the judge cannot be deceived by crimped back saddle feathers that give the external appearance of breadth. It means that a Plymouth Rock back, in actual fact, will have to be "broad its entire length" if the bird is to meet the standard description of Plymouth Rock shape.

Again, in the matter of body shape, the 1923 standard will require that judges shall interpret body shape by handling as well as appearance. When the standard description of body reads "deep and full," a shallow body as determined by handling shall be judged as deficient. The judge is instructed to get his body measurements by spanning the side of the bird, from hip bone to keel bone back of legs, and not to "Hoganize" for reasons which were advanced identical to those set forth in this editorial.

When this system of judging is practiced, then and not until then, will we be up-to-date. Mind you, the A. P. A. is not asking for prizes to be awarded on faded shanks, thin pin bones and old plumage. What is asked for, what is demanded in the 1923 standard, is the judging of birds in the standard exhibition classes on the basis of body shape as well as typical shape. The meaning of body shape in relation to usefulness has been found out and a definite plan for selection and judging can be followed. Just as the walls of a building determine the room inside, so the boney framework of the skeleton determines the internal capacity of a fowl.

No guess work is going into the new standard. No production classes are going in. No culling is going in. But, all is going in that is known, is not debatable, that will assure that the standard will be up to the minute. We are glad to announce this progressive attitude of the A. P. A. as a standard making body. It is in keeping with a half century of effort to make the standard bred bird of our show rooms the highest type of domesticated poultry known to man.

We stand for progress. We believe in injecting into the judging system all that is definitely known and established about utility. We are opposed to special utility classes, in which the birds are judged by certain specific and salient points over-

looked in the judging of standard exhibition classes. It is for us, as breeders and judges, to broaden our understanding that the standard exhibition bird may ever meet all competition.

The world do move. Just the other evening we sat by the shores of Lake Winnebago in Wisconsin, overlooking as wonderful and beautiful a body of water as any inland sea anywhere in the world. The annual meeting of the Wisconsin State Poultry Breeders' Association was being held there. And as we sat in the evening session we were entertained by clear, sweet music coming by wireless from Detroit, Michigan. Who can doubt that the world do move? It is for us, as breeders, to keep up with the progress, at least in our own line of breeding chickens.

Sunny California

Geo. C. England, of California, made friends at the Knoxville convention, and impressed all who talked with him by his sincerity, straight forwardness and progressiveness. Here is a young man, in the early thirties, who had \$204 in 1911, and 1½ acres of land which he had bought at the age of 18, for \$10 down and the balance on time. Today he has a poultry plant that has cost \$49,000, and 10 acres of land for which he paid \$15,000. Every dollar of it came out of the chickens, for there was no other way in which he could get a penny.

Mr. England breeds White Leghorns, single comb. He has owned four 300 egg hens, but is not now striving to produce 300 eggers. He wants 200 egg hens. He likes a hen that lays 200 eggs in her pullet year, 200 eggs as a yearling, and 200 eggs in the third year, if possible. That makes a total production of 600 eggs in three years. He spoke of one in particular that had made such a record.

We asked Mr. England what in his opinion would be the normal difference in egg production between California and the Central and Eastern states. He stated that his birds had been confined to their houses only one day last year, because of bad weather, and that the difference in egg production, based on climatic and seasonal conditions, was probably 50 eggs per hen per year in favor of California.

That extra 50 eggs is not as profitable as it looks, because there is the added expense of buying feed grown in the middle west, shipping it across the mountains to California, and then transporting the eggs across the continent to New York. The differential of 50 eggs in favor of California does compel the conclusion that when Geo. England sets his goal at 200 eggs, the Mid-West, Eastern and Southern poultrymen are securing an equivalent production when their hens lay 150 eggs. Lyle Funk of Illinois says he likes to get a flock average of 150 eggs, that it is a yield that makes money for him. That means an egg every other day for a whole year, with two months left out for the normal process of molting.

It is time that the interested public returned to sanity on this egg question. There is value and merit in the subject. There is great importance in establishing the fact that potential egg laying ability is inherited and transmitted as a unit character; and that the breeder should practice trapnesting to isolate that quality, and employ the system of line breeding to intensify the invisible hereditary unit of high-gear egg production. It is well to discuss the problem from this educational standpoint, but it is dangerous to promote the subject as a fascinating piece of propaganda.

Sprouted Oats

If a considerable portion of the grain fed during hot weather is given in a sprouted form to growing stock they mature much quicker and at less expense. The older birds pass through the molt more quickly and in better condition when kept supplied with an ample quantity of succulent sprouted grain. The result is that the hens come back into laying condition earlier in the winter and lay more consistently through the cold winter months.

“Delighted with our egg record
from the 35 hens bought we never gathered less than 22 eggs and several times 32 eggs a day.
U. R. Fishel's White Plymouth Rocks for us.”

They please others, therefore, they will please you. Why fool away time and money on poultry about which you know nothing? For over thirty years I have given the Poultry Industry the “Best Possible In Poultry.”

HOMESTEAD Vigorous Silver Strain CAMPINES

They Dominate in the World of Campines. AT MADISON SQUARE GARDEN, 1922 Homestead Campines made practically a clean sweep, winning 1-2-3 cock; 1-2-3 hen; 1-2-3-4 cockerel; 1-2-4-5 pullet; 1 young pen. This win, added to their big win at Boston and New York state fair, prove that they dominate in the world of Campines.

EGGS NOW HALF THESE PRICES

Start right and your poultry keeping will prove fascinating and profitable. You cannot secure a better producing and money making variety than Homestead “Vigorous Strain” of Silver Campines. Eggs—One setting, \$10.00; two settings, \$17.50; extra choice selection, one setting, \$15.00; two settings, \$25.00; Single birds—Females, \$7.50 and up; Males \$10.00 and up; Pens, \$40.00 and \$50.00 and up.

Homestead Campine Farms Box A Wayland, Massachusetts

Only the Candee Shuts Out the Surplus Heat

Would you run an auto that had only one brake? Or would you want two-sets of brakes?

The Candee alone has the "two sets of brakes," consisting of a regulator on the the heater, and another regulator on each 300-egg compartment WHICH KEEPS THE SURPLUS HEAT OUT OF THE EGG CHAMBER.

Supplied In Single or Double Decked Machines

Start With Any Size—All Candees are sectional. Extra sections can be added any time, without loss on the original investment. Larger heaters supplied free, when needed.

For Commercial Hatchery—Many localities today offer excellent opportunities to start a Hatchery, selling Baby Chicks and doing Custom Hatching. Candees are ideal for this work.

Easily Installed—Candees are shipped all built with heating pipes in place and any handy man quickly sets them up. This saves expense and makes the first cost low.

Easy to Operate—Having the double heat control a Candee only needs a few minutes' attention daily. Fuel cost is less than 10 cents a day on a 1200-egg size.

Think This Over—Look around your neighborhood and see how many chickens are kept. Investigate the possibilities of a hatchery. You can put a Candee in your house, cellar or basement.

Get Our Catalog—Shows the large and small poultry and duck farms in the United States and Canada, tells how they started and has many useful hints. Sent Free upon request.

Candee Automatic Sectional
Incubator

Candee Incubator & Brooder Co. Oct. 22, 1920
Eastwood, N. Y.
Gentlemen: It gives us great pleasure to in-
form you that the Candee Incubators purchased
from you some time ago, which provide us with a
hatching capacity of 55,000 chicks, has proved more
than satisfactory. Yours very truly,
PUGET MILL COMPANY, by W.A. Irwin.

Because the Candee Incubator comes in all-built 600-egg sections it can be arranged in any way desired. It can be set up in a straight row between the cellar posts. It can be set up as a double row or the sections can be extended into a wing or even two wings if necessary. Thus the Candee Incubator can grow with your business no matter what the shape of your incubator cellar may be.

CANDEE

Each Egg Automatically Turned Whether Trays are Full or Only Partly Full

QUICKLY done by a master lever, in any capacity up to 10,200 eggs. No need to handle the eggs (except in testing out) as they are cooled by opening the egg chamber doors.

You can do this with a Candee because each 300-egg compartment has its own heat supply and it does not affect any other compartment.

Why Candee Hatched Chicks Are Best

Healthy Heat—Hot water is recognized as best for incubation.

Properly Regulated—Each compartment is run at the right temperature, depending upon when the eggs were set. Each compartment has its hot water supply and regulator.

Evenly Distributed—There are no cold spots in a Candee. The heat is evenly diffused over all of the eggs in a compartment.

Circulation of Air—It is a slow movement, free from drafts or strong air currents. Fresh air is always admitted through fixed openings in the bottoms.

Read this letter from a Candee user, who handles R. I. Reds and every poultryman knows that incubating Reds is a real test:

16,685 Chicks from 500 R. I. Reds

Great Bay Farms, Greenland, N. H. July 21, 1922.

I keep 500 hens which I am increasing to 750. Have two 3,600 Candees and I averaged 60 and 65% for the past season, which as you know is a lot better than the average poultryman does hatching Reds. 50% is a good average. I hatched 16,685 chicks this season. I am perfectly satisfied with the Candee Incubator not only because I believe it will hatch a higher percent for me, but because of the prompt and courteous treatment I receive from your Service Department.

THOS. J. BRACKETT.

"Everybody In the Neighborhood Is Interested"

Renie Johnson of Kentucky sends the above picture of one of their neighbor girls hob-nobbing with a hen they call "Singing Jessie."

This customer of ours started in the chicken business over 8 years ago and tried out nearly all kinds until he purchased "Famous" Anconas—and there he stopped. He concludes his letter with a somewhat significant statement: "The old saying is 'egg money is pin money,' but if you have Anconas they will build houses and pay any kind of a debt."

SHEPPARD'S "Famous" Anconas

are earning much more than pin money for their owners. Egg money is big, BIG money. It is not uncommon for my customers to report that their birds average to earn a dollar a month per bird. They are TREMENDOUS PRODUCERS—but I don't ask you to take my word for it. Send for the 100 page catalog. See how these birds have been winning for me at Madison Square Garden, New York—read how they won for my customers—read of the astonishing egg-laying records both for single birds and flocks—then you will understand why egg money is no longer pin money.

CURRENT NOTES AND COMMENT

Poultry Shows.

The season rolls on. Here we are again on the threshold of another poultry show season. As this issue of the Journal goes into the mails, the Ohio State Fair opens at Columbus. That big event of the East, the New York State Fair, will be held at Syracuse from the 12th to 16th of this month, September.

Allentown and Hanover, Pennsylvania, come the week of September 19th to 22nd. They are followed by historic Hagerstown, Maryland, October 10th to 13th.

How time does pass! Here we are again with young stock up and ready for the shows.

Better business at better prices awaits those who will prove the quality of their stock by winning at a poultry event of importance. Exhibit and thus prove the merit of your line. You cannot win if you do not show. Are you ready for the race? Starting time is here again.

* * *

Intensive Methods.

A gentleman telephones: "I have an acre and a quarter of alfalfa. Will it hurt the alfalfa, will I harvest less of it, if I let my 200 hens run on it?"

Where are the 200 hens, now? Any man with 200 hens should have an acre and a quarter of run for them. The intensive system of keeping hens, which is popular at this time, is artificial. The dangers of disease and loss are greater. The cost of production is higher. Land suitable for poultry farming is not so expensive that it should be measured by the foot.

In lean years the man with adequate acreage is the one who gets by to best advantage. The crowded plant, with highest production costs, and greatest danger of loss from disease, is the one that gets hit.

* * *

Easy Money.

A young man in New York State, writes: "Would you kindly give me the cost of running and equipping a poultry feeding station that will have 10 to 20,000 head on feed? It is my intention to dress on premises. It is my intention to install the latest equipment, including ice machine, 14x30.

"Would you please advise space required? Could you give me the records of any going concern, the cost of operation, the capital required, and profits realized on money invested?"

"Would appreciate kindly if you would let me have some photographs of a like plant that you might have."

In reply to this letter, permit us to say that the poultry business is pretty big. There are many different angles to it. We do not pretend to be familiar with, or represent "every poultry interest." American Poultry Journal is a producer's paper. More particularly, we represent the producers of purebred poultry. They are the men who made the breeds, who know breeds and breeding, and they are the only group who do know what is known about these things. Without them there would be only degenerate mongrel chickens in this land. Others know more about buying, shipping and refrigeration. They have their own trade papers, such as the Produce Review, published by Urner-Barry, Chambers street, New York, and the Poultry and Egg Bulletin published at 208 N. Wells street, Chicago.

The crate feeding of poultry is a business carried on by the big packers, who are buyers of poultry after it is produced. It is a highly specialized business. The U. S. Bureau of Chemistry, through the Food Research Laboratory has made exhaustive studies of this branch of the poultry industry, and bulletins covering that research can be secured from the Department of Agriculture, Washington, D. C.

Free-Conkey's Poultry Book

80 pages chock full of information about the feeding and rearing of chicks, culling of hens, etc. Tells how to keep chickens healthy and how to make them pay. Whether a beginner or a professional, Conkey's Book is worth dollars to you. Sent for 6 cents in stamps to pay postage. THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

Crate feeding, however, is not a business for a man who has a vague idea of feeding 10 to 20,000 head. There are too many people in the world looking for "easy money." Friends, the world is surely, and not slowly, getting back to the old basis of delivering an honest day's work for an honest day's pay, and being contented. The "get rich quick stuff" is fading away. We are about to see a return of old times.

In those older days a young man who wanted to go into the fattening business would have first apprenticed himself in the fattening sheds. He would know more about a feeding battery than a photograph tells. He would know more about feeding than is given in a printed formula. He would know adequate ventilation by the smell, and he would know fleshing quality in the raw stock by the feel. Too many young men today want to cut short the period of preparation. Moses spent 80 years of preparation for a life work of 40 years and died at the age of 120. He did something.

* * *

The Storage Pack of Eggs.

The quantity of eggs in storage this year is 9,812,000 cases compared to a five year average of 7,022,000 cases.

Holders of the 1922 pack of eggs have been planning an "Eat More Eggs" campaign. The egg is one of the very best articles of human food. It is not fully understood nor appreciated by the public. Although consumption is great and growing, consumption could be materially increased if the public fully understood that eggs are not high in price, that they are not a luxury to be used sparingly, that they are, indeed, a complete food sold at a reasonable price.

The purpose of a big "Eat More Eggs" campaign would be to reduce storage stocks, and stimulate egg consumption in a year when strikes have reduced buying power on the part of a large section of the public.

The fresh egg market, which will open with a swing this month, will not reach peak prices until Thanksgiving. These poultry-farm eggs are the best quality eggs produced. They are the fresh eggs which are always produced under the best conditions, for scavenger hens do not lay from September 1st to February 1st. It costs money to produce these eggs. They are the great American egg.

The size of the Spring egg flow, now in storage, has no particular bearing on September to February production, although there is some relation between egg prices whether the eggs are storage or fresh. Propaganda directed to consumers pointing out to them the practicability of heavier egg consumption, would help both grades, fresh as well as storage.

* * *

Retouched Photographs

A. S. Carter, Maine, writes: "Would you kindly print the following in A. P. J. together with any comment you may make? Thank you.

"Why is it that we never see the real pictures (or reproductions from real photographs) of winning fowls at shows? All we see is the same thing over and over again, work by poultry artists, picturing the ideal fowl. For instance, we see the first cock at Madison Square Garden (doesn't make any difference what breed), then a picture of the second cock, and he looks exactly the same as the first, only holding his head in a different position.

"Why cannot we see the actual reproduction from real life, instead of artist's paintings? Then we would know just what the real article looks like."

The average man will say that there should be no retouching since it is hard to define just how far finishing off a picture may go and be within the limits of right. On the other hand the ordinary unretouched photo of even a good bird is frequently unfair to the specimen and misleading to the public, for photography often plays funny pranks in lights and shades, and if the artist could not retouch his work, there would be far fewer good pictures for illustrative purposes.

Retouching can be carried to the point of unfairness, but it is doubtful if it is ever as

Egg-Capacity in Four Years

Buckeye Mammoths built in three sizes:

No. 7 Capacity . . . 10,388 eggs
No. 8 Capacity . . . 4,608 eggs
No. 6 Capacity . . . 2,440 eggs

Another amazing instance of rapid and sound growth, due to real business methods and the Buckeye Mammoth—the real business incubator.

Four years ago the Farrow-Hirsh Company, of Peoria, installed their first Buckeye Mammoth—a No. 6, replacing a 5,000-egg machine of another make. Their satisfaction was expressed a year later when they purchased seven more No. 6 Buckeyes and one No. 7. Last year they added three No. 7's. This year they have already purchased *ten more No. 7 Buckeyes*, giving them a total egg-capacity of 164,672.

While they have quadrupled the size of their hatchery since they began, they have increased their egg-capacity more than 67 times—a remarkable illustration of the compactness and space-saving of Buckeye Mammoth Incubators.

They attribute much of their success to the accuracy with which they can gauge each Buckeye hatch—no guesswork—the strong, robust quality of the chicks, and the extremely low labor and operating cost. They have steady, satisfied customers in every state in the Union.

Today there are more than eight hundred successful hatcheries throughout the United States and Canada using Buckeye Mammoth Incubators—and not a single instance of failure.

We will be glad to send our Buckeye Mammoth Catalog which tells all about this remarkable invention. Let us show you how to start small and grow big in the commercial hatchery business.

Silver Campines

Green Sheen Strain

I HAVE 400 Campine chicks, the oldest about five months. They are the biggest bodied, best maturing lot I have ever had. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

misleading as some claim for it, for the pigments that an artist paints on a photograph, when he over does the thing, usually spoil the picture, and are discernible to nearly every reader, thereby discrediting the breeder who insisted on a remade, smeared up picture.

Professional photography in the poultry business is in the hands of high class men who have the respect for the public, and they are men who value their good names too highly to grossly impose upon the intelligence of the interested public. The raw and amateurish work of seven or eight years ago is no longer conspicuous.

That many of the best models resemble one another is not at all unusual when one considers the pronounced uniformity of the winners in the hotly contested classes of the big shows.

* * *

Duck Propaganda.

The Long Island duck growers have a strong co-operative organization in New York City for the marketing of their green ducks. These are 10 week old ducks that weigh 5 lbs. each. Some of the growers on Long Island grow 50,000 to 90,000 green ducks a year.

The Trans-Atlantic liners were good customers, but during the war they didn't cater to passenger trade, a condition that, coupled with the high price of grain, hit the Long Island duck growers a severe blow. But, since the war, with wages high in New York City, boats running on passenger schedules, and feed cheap, the duck growers have been reaping a harvest. Lice and mites do not bother ducks. They require heat in the brooder only a short time. At 10 weeks of age they weigh 5 to 5 1/2 lbs. each.

Recently the duck co-operators shipped 50,000 ducks to England to feed American tourists, and the duck people took the opportunity to announce the sale, which in reality was only a week's receipts at their New York market, for they sell 45,000 to 50,000 ducks a week.

However, "50,000 ducks shipped abroad for tourists" made a good headline and then the fine work came in farther down in the article. We quote:

"Ducks Cheaper Than Chickens."

"People are beginning to realize that duck meat is not a luxury but a standard article of diet. The chain meat stores ask .30 to .32 cents and the average butcher asks 35 cents and the high priced one gets 40 cents at retail.

"Compare this with chicken and you find ducks are much cheaper, as chicken goes to 45 and 50 cents a pound.

"The average duck is 10 weeks old when dressed, the average chicken may be six months older. A full grown duck is as young as a broiler.

"Why the high class hotels ask \$2.50 for half a broiled duck nobody knows.

"Hotels have fostered the idea that ducks are a high class luxury while chickens, in the opinion of hotels, are not a luxury. Yet at wholesale and at retail ducks sell for less than chickens.

"There is a big demand for ducks this year, largely due, I believe, to the extensive advertising campaign carried on by the duck men. Two five-pound ducks will feed eight people. I recall a year or so ago buying two five-pound ducks at 27 cents a pound, or \$2.70. My family of four with two guests had a hearty meal and we had enough left over for luncheon and supper the next day."

Green ducks were at one time known as a "gold brick." "Two five-pound ducks" sounds big, but compared to the meat on two five-pound chickens dressed and roasted, the ducks are a frail second. The housewife knows it. That is why there are a hundred chickens grown, sold and eaten, to every duck.

But, organizations persist in telling how much cheaper and better their products are than those of the chickenman.

One lady demonstrator recently said, "Don't use any more eggs than necessary; they are too high in price." Her reason was very scientific. She had worked the whole thing out on a basis of calories. In point of fact, nobody buys eggs for their calories. If calories—heat units—are all the dear lady

Get More Eggs Save Feed!

This Free Book tells how Mrs. Hume made over \$2000 last year from eggs alone—how H. M. Luttrell made over \$5.00 per hen net profit—how you can make more money right today by simple, easy methods that never fail.

I WANT TO SEND every poultry raiser my new, free, 96 page book of money-making poultry secrets. Over 46,000 people say that I have shown them the sure way to make money. Do you know that half your flock is eating up your profits? Do you know how to tell good layers? Do you know how to make every hen pay a good dividend? My free book tells how. Simply send name for your copy **TODAY!**

96 Pages of Money-Making Information; Make Every Hen Pay Big!

This book outlines easy methods that show you how to be sure of big egg production, regardless of weather conditions. It gives the secrets that have given Prof. Quisenberry his world-wide reputation. Prof. Quisenberry is the founder of the Missouri State Poultry Experiment Station; Manager American Egg Laying Contest; Assistant Chief Panama Pacific Exhibition; Secretary Heart of America Poultry Show; author and lecturer. A few of the subjects outlined are shown opposite. There are many others equally valuable.

200 HENS—\$1000

"By following your simple advice on feeding, housing and mating, I sold, from 200 hens and pullets, \$1,288.53 worth of eggs, baby chicks, broilers, cockerels and pullets in exactly seven months. My feed bill was \$246.89. The eggs alone amounted to \$490.92 besides 276 dozen I set in the incubator. My success is entirely due to you. I would not part with information you gave me at any price."—Mrs. Chas. Rooks, Ohio.

FEEDING METHODS BRING BIG EGG YIELD

As a result of the feeding methods you worked out for me, I am sure getting results; in fact, from pens started (October 23, 1920), containing 600 pullets, I received 345 eggs. Very often they run more. One pen of 100 ran 73% today and one around 65% for the entire month. Really I am making money before I expected.—Wm. Sands, Missouri.

OVER \$5.00 PER HEN NET PROFIT.

I thought you would be interested in the record of my flock the past year while using your methods. I enclose the record of my flock of 210 hens for the last year.

Eggs sold (2686½ dozen).....	\$1149.19
Chickens sold.....	217.38
Chickens used at home (70)....	35.00
Increase in flock (138 pullets)...	207.00
Total income	\$1608.57
Cost of Feed	606.72
Net profit	\$1001.85

—H. M. Luttrell, Kentucky.

My Personal Guarantee!

My new book, "Dollars and Sense in the Poultry Business" outlines unfailing methods which I guarantee to bring sure and certain success to poultry raisers. Hundreds write every day, telling of the astounding results enjoyed by following these simple methods. Let me place this Free Book in your hands—without obligating you in any way.

This Free Book Tells You—

How to Get More Eggs and Save Feed,
How to Get Big Egg Yields in Cold Weather,
How to Cull Money-Losing Hens Out of Your Flock,
How to Tell Drones, Loafers and Poor Layers,
How to Tell Good Layers Without Using Trap Nests,
How to Mix and Balance Feed Ration to Get Egg Yield,
How to Select Males or Females That Produce Hatchable Eggs and Strong Chicks,
How to Prevent Colds, Roup and Other Diseases,
How to Avoid White Diarrhoea and Bowel Trouble,
How to Free Chicks From Start to Finish.

wants, she should buy lard, eat lard, live on lard. Her calories would cost less than in any other foodstuff she could buy on the market.

Perhaps we should all feel complimented when chickens and eggs are used as a basis for comparison. However, the poultryman sometimes gets a little tired of hearing about green ducks and calories, peanut butter and molasses coated popcorn. Comparisons become odious.

* * *

Record Cards.

One gentleman remarked: "What a lot of work you are cutting out for the judges."

Yes, making out a record card on each bird is extra work. It is worth extra pay, and that is good. Anything that will result in better pay for the judges, that will help them to earn more money, is good. If judging is to remain a decent profession, judges should not have their fees so largely wiped away by railroad fare and hotel bills.

That breeders want record cards and are willing to patronize with increased entries those shows that provide them, is attested by the letters we have received, of which the following was written on July 31st, "before the ink was dry" on our August issue.

"Am in receipt of your interesting August issue. During the past six or seven years I have bred Barred Rocks. Each season I select a few and send them to the various shows. It is seldom possible for me to attend the show where I have sent my little entry. Sometimes for my trouble a week or two after the show I get a ribbon—this hasn't happened often and most times I get my birds back very much the worse for the hard trip, and getting the birds back ends the procedure.

"Last season I showed two beautiful pullets at Cincinnati. Anyhow I thought they were beautiful but after the show was over they came back to me and I would have given most anything to have known wherein they failed. I could not 'fault' them myself and it would have been a fine education to me to have known their shortcomings. I would have felt amply repaid for my expense and trouble and would have then set about to correct the weakness.

"Use your influential columns to urge shows to supply exhibitors with record cards such as you show in your August issue. I know there are lots of small breeders and exhibitors such as I, who are laboring under the same difficulty. They would willingly pay the entrance fees and other expense of a show merely to get a criticism of their birds. At our coming Knoxville show I am going to show double the number of birds I would send away—just to get them judged. I can be present and its worth the price to have a good judge pass on them.

Very truly,
R. E. GETTYS.

* * *

Oyster Shell.

Many hens do not eat enough oyster shell. When the crushed shells are put in hoppers it is often found that the hens do not eat readily of them.

Lime contained in these crushed shells is used to form the shell of the eggs. When hens do not eat enough crushed oyster shell they may lay soft-shelled eggs.

Some poultrymen throw a handful of the shells in the litter or on the floor of the coop, or in the yards in summer. They are eaten more readily when supplied in this way.

Crushed clam shells are harder than oyster shells and are not as soluble. They are a poor imitation. Oyster shell can be broken in the hand and is of a whiter color than clam shell. Remember, oyster shell or powdered lime stone, is as important an article of the hen's diet as any other food substance she eats.

* * *

Grit.

Some poultrymen let crushed oyster shell serve the extra purpose of serving as grit. This practice is not recommended, for oyster shell is not hard enough to serve as grinding mill stones in the gizzard.

A chicken has no teeth, and after its food is softened in the crop, it passes on to the

Solves Dry-Mash Feeding Problem

gizzard where it is ground by the muscular contraction of the walls of that muscular organ.

Some poultry authorities have challenged the statement that a chicken needs grit to grind its food, but the fact that when a hen is without grit for ten weeks or a year a certain residual amount of grit is still to be found in her gizzard, should prove that it is needed to serve the specific purpose of grinding food.

Oyster shell, being more easily reduced by the acids of the alimentary system, is practically all dissolved and utilized in the system of the fowl, and is, therefore, not a perfect substitute for grit.

* * *

Baby Chick Convention

The International Baby Chick Association held its annual convention at Cedar Point, Ohio, the first week in August. Membership fee was increased to \$25 a year. In addition, each member is to pay \$1 per thousand eggs capacity, the money to go into a national publicity fund to be used to increase the sale of day-old chicks. This means \$100 per hundred thousand hatching capacity. A Vigilance Committee was appointed. This committee is to look out for the interests of the public. The fellow who crosses Barred Rocks on White Leghorns and sells the chicks as Barred Rocks, will upon proof of guilt, be simply turned over to the U. S. Post Office Department for fraudulent use of the mails.

Harry R. Lewis, President of the Chick Association, was unable to attend the meeting, as he met with the great misfortune of a broken leg.

Incubator concerns reported an enormous business. One concern reported the sales of twenty-four 40,000 egg machines to members of the Chick Association during the week of the Cedar Point Convention; and the total sale of 4,000,000 eggs incubator capacity this year. Reports were current that single chick hatcheries had made as much as a hundred thousand dollars this year.

* * *

Death of Fred H. Thayer

Fred H. Thayer, Baltimore, Maryland, passed away July 26th, following an operation. Mr. Thayer was president of the International Baby Chick Association, and will be greatly missed by his many friends, not only in Baltimore, but all over the country.

* * *

President Rigg Doing Good Work

The financial report of the A. P. A., the splendid way in which the sessions of the annual convention at Knoxville were conducted, and the ability with which the presiding officer is restoring dignity and majesty to what has been termed "the largest live stock organization in the world," gives us all reason to be proud of President Thos. F. Rigg, as well as his efficient Secretary, Mrs. Rigg.

It looks like a rebirth of interest and confidence in the A. P. A. Harry Wolsieffer has sounded the situation, and writing in the Philadelphia Record, Aug. 13, said:

"From the spirit shown at the annual convention of the American Poultry Association held at Knoxville, Tenn., last week indications point to a larger and better association in the interest of poultry culture in this country."

Sex in Pigeons

Many poultrymen know a great deal about chickens and very little about pigeons. Perhaps the most puzzling thing to them is to tell the sex of pigeons. Here, Walter Hogan's system will help out. If you can place one finger between the pelvic bones, it is a hen that is or has been laying. If the points of the bones are close together it is a cock.

With James Manufacturing Co.

A. B. Dann has joined the James Manufacturing Company, of Fort Atkinson, Wisconsin, where he will be in charge of the poultry equipment and poultry service division.

Mr. Dann takes to his new position the practical knowledge of more than eighteen years of wide experience in poultry work. Eight years of this time was spent in the poultry husbandry departments of three of the leading agricultural colleges. His many friends will join in wishing him the best of success in his new opportunity with a concern that looks on poultry as a man's business and takes seriously the business of manufacturing equipment.

Four Incubators in One

Our "Four-In-One"

Price
\$138.00

Our FOUR IN ONE 800 egg section has FOUR independent egg chambers (of 200 egg capacity.) Each chamber is a complete incubator in itself.

With this one section you can set FOUR different kinds of eggs at one time or take off a hatch once a week, as you choose.

Sectional Construction

Can be enlarged to a mammoth machine of 9600 egg capacity by adding more sections at any time required.

**Has the most
Uniform Temperature
Efficient Ventilating System
High-Grade Construction**

MOISTURE DEVICE for dry climates and high altitudes.

PRODUCES MAXIMUM RESULTS

We give the most far reaching guarantee that any responsible firm is able to give on their product.

Typical Leghorns in Rich Golden Buff

(Continued from page 845)

equally valuable varieties. It is easy to breed them fairly true to color, and a large flock presents a striking appearance. These Buff Leghorns are usually kept solely for practical purposes, notably for the large white eggs of which they lay so many. I speak here of the Buff Leghorns kept on general farms. They make ideal birds for a farm, having all of the good qualities of the White and Brown Leghorns, and being unusual, striking, and very good looking.

For town and city lots they also have their advantages. The buff color does not show up dirt and dust and smoke in the way in which white plumage invariably does. I now hear someone saying: "They are too wild for me." If your Leghorns are wild it is probably your own fault. Wildness in Leghorns depends upon just two factors. The one is heredity, and the other is treatment. There is a type of Leghorn that is really wild and scary. That quality can fairly easily be bred out of a strain of birds. In general, if Leghorns are wild it is the fault of those taking care of them. If you chase them, kick them, and in general treat them as the dust of the earth, of course they will be wild. They are afraid of you. But if you treat them decently, and are careful not to frighten them, they will become quite natural in their movements; and if you take a little trouble to become acquainted with them, you can easily get them to eat out of your hand. We have at this moment a bunch of young Buff Leghorns, on free range, about two months or so old, that will sit on our lap and eat out of our hand.

And they will stand confinement, too, if proper care is taken of them. I do not advocate raising Leghorns in confinement, but there is no reason why mature stock should not be kept in confinement. I also wish to say that the so-called "Tameness" of certain weighty breeds is not really tameness at all, but just plain clumsiness, laziness, and unadulterated stupidity. Leghorns are always alert and active, and their tameness is the real thing; they become really friendly.

In finishing with this topic let me state some facts which in the year 1922 need no proof. (1) Buff Leghorns and all Leghorns are noted for the production of an abundance of large white eggs. (2) Buff Leghorns and all Leghorns are healthy and hardy birds on the whole and with proper care and feeding are universally profitable. (3) The eggs are easy to hatch and the chicks feather out quickly and grow rapidly. (4) The females commence laying very young and continue profitable production for from 2 to 5 years. (5) Buff Leghorns and all Leghorns not only produce a great abundance of eggs, but while producing these eggs eat very little, thus making them very economical.

Buff Leghorns for the Fancier

As far as the fancier is concerned, it is usually an unexplainable natural preference which leads him to choose one variety rather than another. It would be foolish to produce argument in favor of the propagation of the Buff Leghorn as a variety for the fancier. It would be foolish for this reason: every argument that I might produce would apply with practically equal force to a number of other varieties. There are a number of breeders and fanciers breeding this variety at the present time, and in all probability there will continue to be. We do not look forward to a time when there will be nothing on exhibition at the poultry shows but Buff Leghorns. We do not even wish for such a time. On the contrary, we hope that such a time will never come. But we do hope and believe that Buff Leghorns will continue to spread as Standardbred poultry spreads, and that Buff Leghorns will not only be improved in quantity but also very much in quality.

There are a very great many persons in the United States and Canada who breed Buff Leghorns for pleasure rather than for profit; some of these are located in rural districts and some, possibly the greater part, in towns and cities. We hope that their number may increase to a certain extent, at least. Buff Leghorns are very attractive when shown in exhibitions; and they are equally attractive when well kept on range or in yards.

Standards in Breeding

In the United States the only Standard in breeding is the well known American Standard of Perfection. According to the 1915 edition, Buff Leghorns are identical with all other Leghorns in type and weight. The point of difference is color. The color of plumage is described as "rich, golden buff," though it may be somewhat of a debatable question

what "rich, golden buff" is. The judges do not seem to agree, and the breeders are not entirely agreed either. It is not easy to describe it in words; perhaps the best way in which to get an idea of it is to see it. Of course any pure buff should be free from black or white in spots, bars, or otherwise. And as to "rich, golden buff," it should be smooth and even, neither too light nor too dark (what does that mean, I wonder?) and having a sort of sleekness on the female and a brilliant lustre on certain sections of the male.

Space would fail to discuss fully the various aspects of buff color, and accordingly that will be left to someone who is better fitted to do it than the present writer. Our Standard as it now reads specifies for Buff Leghorns, earlobes that shall be either white or creamy white. I am afraid that some of these licensed judges do not know that. But then, that's all right—there are lots of things that they don't know. I fear that sometimes in hot competition a judge has considered a white lobe a little better than a creamy lobe. But he is wrong, all the same. A creamy lobe is every bit as good as a white lobe, according to the Standard of Perfection as it now stands. In other respects than plumage color and earlobe color, the Buff Leghorn is, ideally, identical with all other Leghorn varieties.

A Few Words on Mating

It is quite beyond the scope of this article to go at length into all of the problems encountered in mating Buff Leghorns. It would not only take too much space but it would perhaps prove confusing to some and would be likely to leave the impression that it is an extremely difficult matter to produce Buff Leghorns that are buff. Accordingly we shall simply take a bird's eye view of the matter of mating.

We therefore beg your leave to quote a few words from a breeder who is far better qualified to talk about mating Buff Leghorns than we are. At our request Mr. C. M. Herren, a Colorado breeder of S. C. Buff Leghorns of the very highest quality, wrote the following for this article:

"I place more confidence in the female, both for type and coloring, than in the male. A good female mated to an inferior male will give better results than a good male mated to an inferior female.

"I want to know the ancestry of both sides of my matings, and while I regard the ancestry of the male as highly important, I consider that of the female more important. While inquiring into the ancestral lines of both males and females, I place more emphasis on the maternal ancestral lines than on the paternal. That is, I place more value on what were the dams, granddams and great granddams, than on what were the sires, grandsires and great grandsires. By knowing the ancestral traits and what are the dominant characteristics, I know what particular traits I may expect to predominate in the progeny of my matings, and am able to increase the tendency toward those that are desirable and to diminish the tendency toward the undesirable ones. This involves the use of the trapnest or of the single mating plan.

"The use of the trapnest is of wonderful value, not only in determining ancestry, but in determining which are the high producing females, which ones are giving poor fertility, and so enabling the breeder to intelligently cull his flock, both as to producers and breeders.

"I am not afraid of mating a male of light plumage to a female of dark plumage; provided both have the desirable characteristics that I wish to conserve. The old bugaboo so ardently preached a few years ago that the progeny of matings of different shades of sire and dam would show meanness in plumage, has, I hope, been driven to the tall timber. In such matings, I do not expect the entire offspring to show a balance of color, but a few will do so, and these few are what we want to use in our future matings if they also show the other traits that we are seeking.

"If my records show superior type to be well fixed in one of my birds, but color not so well established, I do not sacrifice the superior type, but mate such a bird to one of good type and well established superior coloring. I follow the same plan with birds of well established superior coloring.

"This plan does not imply that any bird that is inferior in any respect is ever used in my matings, for no such bird should ever be placed in a breeding pen. It means that we are all working along the line of improvement. The plan stated above is followed only after I have gone through my flock and chosen the very best of both males and females."

Many breeders of Buff Leghorns have been n-times past troubled by having white crop

Help your MOULTERS MOULT

If you want your hens to moult naturally—

If you want them back on the egg job promptly—fall and winter laying—

Then you must make sure that your moulters are healthy and hungry.

They must eat lots, and be able to digest what they eat.

That's just what

Dr. Hess Poultry

PAN-A-CE-A

does for your moulting flock.

It's a tonic that begins with the appetite—improves a hen's whole system.

It has Iron that keeps the paleness away, makes the combs and wattles red—the blood rich.

Pan-a-ce-a starts the food the egg way as soon as the moult is over.

No time lost.

No dormant egg organs after the moult, where Pan-a-ce-a is fed.

Tell your dealer how many nens you have. There's a right-size package for every flock.

100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum

For fewer hens, there is a smaller package.

GUARANTEED

DR. HESS & CLARK Ashland, O.

I spent 30 years in perfecting Pan-a-ce-a.

Win with Hillview Leghorns

We guarantee they will win in any show in the country regardless of competition. Are you going to let the other fellow beat you at your next show? Be wise and book your winners ahead of your competitors. Results are what Hillview birds will give you—you take no chance.—Look what Hillview Leghorns did for one customer at the Dallas Premier show 1921-22. Won 1-3-4 cock; 1-2-3-4-5 hen; 1-2 3-4 cockerel; 1-3-4 pullet; 1st old pen; 1-2 young pen.

First Prize Cockerel, 1921
Chicago Coliseum Show

Winning records such as these can be made only by Hillview S. C. White Leghorns, because they are the better Leghorns

4500 sons and daughters of our Chicago Coliseum Sweepstakes Champions and Egg Laying Contest Winners, are ready now to again make History in America's largest show rooms and National Contest. You NEED Hillview Blood to improve the exhibition and laying quality of your flocks. YOU NEED Hillview Outstanding Money-Making World's Best Combination Strain of S. C. White Leghorns to succeed. They have many years of constructive line-breeding and unapproached winning records back of them that have never failed to produce results.

Our prices are very reasonable. Hillview service is the very best. Catalog free—write today.

Hillview Farm Box 4004 Bentl, Ill.

out in the plumage of their birds, often even despite their using only sound colored birds in mating. This tendency toward whiteness in plumage is, I am glad to say, being overcome. It should be remembered that it is scarcely thirty years since there were no Buff Leghorns. Is it any wonder that white has a tendency to crop out? But, permit me again to quote a few words on lightness in plumage. Mr. Guy Hatten, a noted breeder in Ohio, speaking of light in tails of Buff Leghorns, says the following:

"There are a number of factors causing this lack of color in the tails of Buff Leghorns. One of them is inheritance, for many of the Buff Leghorns a few years back had white tails; and although much of this trouble has been eliminated through better breeding tactics, it still shows up more or less through this source (inheritance). As an experiment one season I used a male that was a producer of very sound buff tails, or tails shaded with smoke, when mated to sound buff hens. I mated him to two hens very sound in surface and undercolor, but having white in tails. Almost all of their offspring were very light in tail. While this one mating is not extensive enough to prove a certainty, it does prove that you must mate sound colored birds to get good color.

"Another cause is mating together birds too light in color, especially in undercolor, as buffs have a tendency (as a whole) to run lighter each generation, and this lack of color will show up in the wings and tails first. So if you favor the light shade of buff, use as breeders only, birds having very sound surface color and with good undercolor. If your hens run light, especially in tail, use a male a shade darker, and vice versa. You will get more sound colored birds from this mating than you would from a lighter mating, and you will have fewer birds too light to breed from.

"Therefore, to eliminate white tails and other light defects, use only your richest colored birds, those carrying the most color pigment, not necessarily too dark by a shade, although it is better to use birds a shade darker than you wish to produce than a shade lighter. Line breed and pedigree your chick, at least from one small mating, so as to know the prepotency of your best birds."

Other Problems in Breeding

Coarse combs, wattles, and earlobes were once a great problem in Buff Leghorns. Owing to systematic and intelligent breeding this has been eliminated, and now it is no more troublesome in Buff Leghorns than in other Mediterranean varieties. Thumb marks, over large combs, lopped combs in males, side sprigs, and the like, have been once for all put under control, and are now giving no special trouble. I speak of the best strains of birds—i. e., of really Standardbred birds.

Likewise high tails and squirrel tails, pinched tails in females, and poorly furnished tails in males, are being overcome by systematic effort and it is not necessary to go into these matters in this article.

Conditioning for the Show Room

Buff Leghorns do not need particularly different treatment from other similar varieties in getting them into shape for exhibition. While it is really outside of the scope of this article to go into the methods of conditioning, the aim of this article is to convey information, and a few words may not be out of place. Mr. George Rex, a Pennsylvania Buff Leghorn fancier says, in part:

"The conditioning of Buff Leghorns for the show room begins when the chick leaves the shell, and with the old stock, when the breeding season is over. Separate your male birds from the hens as soon as the breeding season is over, as this will help them to take on flesh, to take them over the molt. Chicks hatched from prize matings should have nice clean, dry, shady quarters. I keep my chicks cooped till they are two weeks old; then I let them out on a grass run, as grass keeps their legs clean and yellow, and shade will keep their plumage from bleaching out.

"When the chicks are about three months old, select your promising specimens and put them by themselves. Do not allow your choice cockerels to run with a large flock of cockerels as they are likely to have a spike or earlobe torn, which will spoil them as show birds. Through the summer and autumn months try to coax your choice specimens to eat from your hand. Pick one up once in a while. By doing this you are getting them ready for the training coop.

"One week before showing wait until dark, and then take a lantern and take the birds you intend to show and place them in their training coop. This will give them a chance to settle in their new quarters till the following morning. Then give them a little greens and their morning feed the same as usual,

and let them rest until dark. Then walk past their coop slowly so none gets scared. After a bit get close to the coop, open it up, and then work slowly. Put your hand on their back and get them to stand still. Then try to play with their wattles. When you can do this you can get them to pose in any position.

"About the third evening, sponge their comb and shanks with warm water and soap, and put a few drops of vinegar on their comb, face, and wattles, as this will clean pores and make them ready for the general cleaning the day before you ship them to the show."

A Word to Breeders of Buff Leghorns

Let us not only try to breed good Buff Leghorns, but let us try to breed more of them. Let us advertise our birds more. Let us be honest in our claims. We do not have "the best breed of chickens." There are at least several other varieties that are every bit as good, and, possibly, one or two that are just a trifle better for certain purposes for which Buff Leghorns are also adapted. Let us advocate purebred, Standardbred poultry, and let us advocate better Buff Leghorns. Let us try to have a bigger, better, more useful American Buff Leghorn Club. And why not enter more Buff Leghorns in the egg laying contests of America?

What Will the Future Be?

We have every reason to believe that Buff Leghorns will not only maintain their present popularity, but will increase in numbers. Their present place has been achieved by slow, sure progress. There are some varieties of poultry that have been rapidly spread by lavish advertising. This produces a sort of artificial and uncertain popularity. But the progress of Buff Leghorns has been achieved by their merits and by slow, sure, effective effort. If the breeders can stick together for their common interest, they can do much to advertise Standardbred poultry and Single Comb Buff Leghorns.

Filth Diseases

Roup, chicken-pox, white comb, scaly leg and other diseases are all aggravated by filth, and might be called filth diseases. Yet one hesitates to diagnose these diseases as due to filth, because every one is more or less sensitive about this word filth being associated with any part of their premises. To avoid it, it is necessary that the poultry house should not get too dirty. The nice, clean straw which went down in a thin layer because the straw is high in price is left on the floor too long. It becomes damp and foul-smelling and thick with droppings. In fact, it becomes a normal place for germs which attack the chickens where they are weakest. Some doctors claim that roup and chicken-pox are the same disease; that both are in the blood. One fowl might have a break in the skin through which the germs enter and develop as chicken-pox; another fowl might be susceptible to colds and come down with roup. Another might escape both chicken-pox and roup, but have a very bad case of fever, or sorehead, from dirty litter. Favus usually attacks birds that are anaemic; while roup and chicken-pox attack birds that are apparently in the best of health.

Cabbage is liked by flocks that have grown up on it; other flocks leave it. Waited from certain chicken houses along the roadside, we often smell rotten cabbage. The slime from decayed green food provokes disease, but so long as the green shows, the owner of his flock rests serenely confident that her fowl have green food.

Filth comes from water as well as from food. Who has not seen slimy water troughs and pans in the chicken house? Who also has failed to see hens fed on ground so dirty that they could not escape dirt and manure with their food?

Chickens really don't like dirty food. However, they cannot resist the germs which come from continued eating off of foul ground. Some have more resistance than others, and do not become diseased through food, but let a bird of weak resistance become infected through food, and the germs seem so intensified by their development through his frail body that they successfully attack the entire flock.

Mites and lice are a visitation, not a disease, but this pesty visitation is increased through filth.

Chicken houses cannot be kept surgically clean, but common sense cleanliness will add greatly to the comfort and health of the flock.

Ont. Wm. F. Walther.

I'm goin' to paint th' inside of my chicken coop, to keep them hens from picking th' grain out of th' wood!

—“the incubator that hatches the most chicks, the best chicks, with least labor and at lowest cost.”

How the Poultryman May Know His Hens

Continued from page 843

When the hen molts she has finished her laying season. The good producers keep on laying late into the fall, until approaching winter forces her to stop and renew her coat of feathers. The poor producer exhausts her laying energy in spring and early summer and starts molting in July, August or Sep-

Left, good layer, showing good, physical condition in contrast with poor layer, right.

tember. She has a greatly shortened laying season, but prolongs her molting period throughout several months.

One of the best tests of a hen's persistence and value as a producer is her ability to lay during the fall. As already pointed out, the poorer hens stop laying early and molt before the average of the flock. In culling it is important that the laying condition, of the hen be noted. Hens are kept primarily for egg production, and as long as a hen is laying she should not be sold.

Applying the Culling System

In culling a flock each bird must be handled and her individual characteristics carefully studied. All the culling points should be taken into consideration and judgment be based upon the total evidence instead of paying attention to only one or two points. A remarkable correlation will be found to exist between the different characteristics on either the extra good or the extra poor birds.

The best hens will not be molting before October 1, their shanks will

Now Is the Time to Preserve Your Cheap Summer Eggs

Have Fresh Eggs to Eat and to Sell All Winter

Save every egg now that you possibly can. When eggs are scarce and high next winter, you can get winter prices for summer eggs. Each 50c package of K. & G. Egg preservative should add \$10.00 to the value of every 25 dozen eggs you preserve.

K. & G. EGG PRESERVATIVE

Keeps Eggs 100% Perfect

K. & G. Egg Preservative guaranteed to preserve clean, fresh-laid eggs perfectly for one year. No change whatever takes place. No foul odor, strong or stale taste is imparted to eggs. The eggs can be used for all purposes. The yolks do not break down. The whites will whip perfectly. K. & G. is not liquid glass or any other slimy solution. It comes in powder form, makes a clear solution, clean, cool and pleasant to put

eggs in. K. & G. is cleanest, most perfect egg preservative in the world.

be practically free from yellow, the skin will be soft and pliable, the bones of fine quality, the abdomen soft and flexible, and they will show a body depth of at least four fingers and a pin bone spread of three fingers.

The poorest layers will be practically through molting by October 1. Their shanks will show prominent yellow, and they will have coarse skin and bones and a hard abdomen. Their body depth will be less than three fingers and the pin bone spread be not more than two fingers.

Left, good layer in contrast with poor layer, right, which has more shallow abdomen and body. Observe this picture also from a side view.

The good hens and the poor ones are easily picked, but in every flock there are some birds on which the distinguishing marks are not so distinct and may sometimes be rather contradictory. Thus one hen may be an early molter and yet show good body depth. Another bird may molt late and at the same time show poor quality. Birds of this type usually are medium producers, and the owner must decide whether they should be kept or sold.

Some difference is found in the relative thickness of bones in the different breeds, and there is some variation in maximum body depth between the large breeds and the small breeds, though not so much as might be expected.

The way to learn to cull is to pick up some birds and study the different points until the distinguishing differences between a good layer and a poor layer become fixed in the mind, and then go through the flock and divide them into three lots, the good, the poor and the medium. Dispose of the poor lot and then decide whether to keep or sell the medium bunch.

OLD RELIABLE MAMMOTH INCUBATOR

Again Far in the Lead — Away Ahead

Here is the correct answer to your incubator problems. The growth and development of the poultry business calls for larger plans, larger units, for hatching purposes. The Old Reliable—the standard of all incubators, now presents a grouping sectional system that in every way ranks first. It is far removed from the experimental stage. It embraces all the well known principles of the Old Reliable, the result of 42 years study and effort to reach perfection and produce incubators in style and form to meet the public's demand. The original fundamental principles have never been deviated from. The growth and expansion, and all that adds to ease of operation, convenience and economy, as well as efficiency, have been carefully safeguarded in every change we have made.

The Old Reliable Standard Mammoth

Is made in both hot air and hot water styles, in sections of 1,100 egg capacity. These sections may be used in singles, doubles or three-high. You cannot afford to ignore questions of responsibility and reliability when selecting your equipment. The constant flow of testimonials from satisfied customers is our warrant for the belief that we are offering you the best incubator equipment possible to produce.

The Reliable Sales book contains complete information of our full line of incubators; likewise a complete line of poultry equipment and accessories. We can furnish everything necessary for operating the largest or the smallest poultry plant. Everything we make or sell is supported by a positive money back guarantee.

Write for catalog and dealer terms and prices.

RELIABLE INCUBATOR & BROODER CO., Box 1, QUINCY, ILL.

KEIPPER Exhibition Coops Help YOU WIN

Nearly all of the up-to-date poultry shows in the country used Keipper All-Wire Coops last year. The added attractiveness they lend to the exhibits makes the shows a better success financially.

Exhibitors are demanding Keipper All-Wire Coops and give preference to shows where they are used.

Neither the bird nor the shows look right in old fashioned, solid-partitioned coops. The Keipper All-Wire, electric welded, Collapsible Coops are a boon to the fancier.

For conditioning and training before the shows you should have a few of these coops. Then your birds will feel at home in the show room.

Write for **FREE BOOK** of poultry specialties including, egg boxes, shipping coops, trap nests, fountains, feeders, etc. Tells how to condition birds for shows.

Rented to Fairs and Shows with Purchase Privileges

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high priced food to lousy chickens. It's a dead loss—don't do it. Use Kilamite. No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

(THE END.)

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Kilamite vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54 Quincy, Illinois.

A Beginner's Experience

I am a stenographer and during the ten years I was in the office I always made a large salary and incidentally spent it. A year ago this spring I left the office with the view of trying out the chicken business for one year, and the understanding in the family was, that, if at the end of the year we showed a reasonable profit on our back yard flock we would go into it on a commercial scale. It is about that year's work that I expect to write, principally for the benefit of persons, who, like myself, are just starting out.

First of all I bought three settings of White Leghorn eggs at \$2.00 a setting and didn't get them home until they were almost three weeks old. Needless to say the hatch was poor. We got eight chicks, but we bought 100 S. C. White Leghorn chicks and had very good luck. We then made our biggest mistake, viz., buying six dozen eggs from various farmers who kept just "chickens." This, I consider, was our most expensive mistake. Some of the chicks had never feathered out in October although they were hatched in May. In one way it really was a blessing in disguise and we learned our "never again" lesson. Cheap stock is a case of throwing good feed money after bad stock money. By October 21st we had 94 pullets and a bunch of mixed cockerels we were holding over for family use as roasts during the winter, which was another mistake as they ate almost as much feed as the pullets in addition to crowding. October 28th we got our first egg and I assure you no egg before or since was just like that one. At that time eggs were 50 cents a dozen. The highest price we ever got was 60 cents and this only a short time in December. In December we found we were losing money on our cockerels and sold 64 pounds of meat to a restaurant keeper in town at 16 cents a pound. This rather took the starch out of us for ever going into the meat end of the business. However, as if to make up for this, our pullets settled down to break the records and I feel we are justly proud of our success. We have culled them down until we have 72—and still have some more trimming to do.

To July 1st, we secured approximately 750 dozens of eggs and in spite of the fact that the price stayed at 15 cents a dozen through April and 18 cents through May we have already paid for all equipment, house, fences, stock, feed, etc., and show a profit of \$35.00 and our laying year will not be up until October 26th. We pay as much for our feed as if we were near a good market. I have kept a record of the price of eggs in town as compared with our prices and I feel confident we lost easily 10 cents on every

dozen eggs, which would be approximately \$75.00. I might add I have less than a quarter acre of ground fenced in, which I have rented from a neighbor. As my hen house would not accommodate many more chickens I did not undertake to raise a lot of stock this year but contented myself with one setting of high egg record eggs.

The mail man fixed ten of these eggs before I ever saw them and out of the remaining eight I got five chicks, two cockerels and three pullets, which I expect to use next year to improve my flock. It is my intention to buy a little really good stock each year to raise the average from year to year.

We have made plenty of mistakes, paid big prices for our feed, sold our eggs for a song, lost money on our cockerels and had our chalk white shells colored up to a nice cream tint in the Spring when we had 25 orders for hatching eggs at \$1.00 which we necessarily had to cancel, and still we are for the poultry business. I can see where and how I must overcome these mistakes and expect to meet and handle future mistakes in the same manner. We are now looking for a farm. We have many things to learn but we have also learned a lot. The most important impressions received are, first, you can't get blood out of stone, neither can you get eggs out of inferior stock. Second, you can throw a hen out of laying by suddenly interfering with her diet. Third, it is just as important to get the money out of your eggs as to get the eggs out of your hens. This last item I consider of equal importance to securing the eggs. It is my intention this winter to market my eggs in dozen cartons under my own name. To my mind, the poultry business suffers as much from poor business management as from all its other troubles combined. Right here I wish to say I have run across unjust discrimination. Any huckster or store (shipper) will take any chicken at any weight and will not take a Leghorn at a higher weight. I have sold Wyandotte cockerels weighing 2 pounds readily, and cannot sell Leghorn cockerels or hens at 3 and 5 pounds respectively. I am glad to see Leghorn breeders are getting together on this.

As we were not going to have any young Leghorn cockerels for broilers this spring, we hatched 40 White Wyandottes for eating, and here was where we had some wonderful luck. We did not lose one chick and to date they have cost me approximately \$6.00. I sold 16 last week weighing 2 pounds each at 35 cents a pound. I attribute the rapid and healthy growth of these chickens to good stock and proper housing. We have designed a brooder house which for practicability and cheapness cannot be beat. Miss A. F. Cowan.

SCORE CARD FOR JUDGING PRODUCTION QUALITY AS RECOMMENDED BY PROF. T. S. TOWNSLEY.

Character	Perfect Score	Desirable	Undesirable	Score Given				
				1	2	3	4	5
General Appearance.	10	Strong, active, well formed, medium size. Friendly.	Wild, cross, lazy, weak, over-fat, scrawny or deformed.					
Head and Adjuncts.	25	Stout, well curved beak; broad head; bright, prominent eye; red, waxy comb. Refined, lean face.	Crow head; eye dull or sunken; pale comb lacking character. Fat face.					
Body Conformation.	25	Chest broad and deep; back broad, straight, smooth, not pinched; keel long. Smooth overhairs. Large capacity.	Narrow chest; knock kneed, pinch backed, knobby hips, short keel; body shallow, small capacity. Roach backed.					
Handling Quality.	15	Skin soft, oily and pliable; breast bone thin and smooth; pin bones thin and straight; abdomen flexible.	Coarse dry skin; thick, rough breast bone; pin bones thick and not flexible; abdomen small, hard or baggy.					
Condition.	10	Good flesh; full feathered; laying.	Thin; over-fat, sick; broken-down; not laying.					
Pigmentation.	10	Eye ring, vent, beak and shanks faded if laying.	Prominent yellow in eye ring, vent or beak in mature hens.					
Feathering.	5	Late molt; quick feathering.	Early molt; slow feathering.

Angell says

Albert Angell Jr.

To make money out of your hens and pullets this winter the eggs must come in abundance in October, November and December—the months of high prices.

Hens and pullets laying these months will pay for their board for the whole year. Allow them to go “eggless” and you will come out at the small end of the horn, “when the roses bloom again.” See to it that the board bill is paid in advance—then every month thereafter will net you 100% in eggs produced.

Cull closely, weed out the drones, market the old hens and the early moulters, push the pullets with Vitality Growing Mash and you will begin to see profits coming your way.

Arrange your laying quarters according to the plan illustrated herewith (see cut) and **DON'T FEED SCRATCH GRAINS IN THE MORNING**. Simply follow the secret of the **VITALITY SYSTEM** and you will be successful from the start.

Look out for the hens that roost in the daytime...something is wrong. Keep the litter a foot deep on the floor...feed **FOUR-O-CLOCK SCRATCH GRAINS** at **FOUR O'CLOCK**, one quart to each dozen layers...then you need have no fear of over-fat hens and “daylight loafers.”

Keep Vitality Egg Mash in the Vitality Feeder before the hens at all times—always dry...just as it comes from the bag. Grit, oyster shell and charcoal in the hopper. Clean and disinfect regularly each week. Water is as important as Vitality Egg Mash. Deprive the hens of either for one hour and you will notice the result in less eggs produced.

Adopt the Vitality System in conjunction with the use of Vitality Egg Mash, Vitality Growing Mash and Four-O-Clock Scratch Grains and Rosenbaum Brothers will guarantee satisfactory results in egg production.

A Reputation of 51 Yrs.

1871

Be sure the signature of Albert Angell, Jr., is on every sack of Vitality Egg Mash, with our guarantee of absolute satisfaction when fed according to directions.

VITALITY EGG MASH IS NOW MADE UNDER MR. ANGELL'S ORIGINAL FORMULA, IMPROVED, WITH BUTTERMILK. It is the result of years of experience with every known formula and ingredient. It will positively produce more eggs at less cost than any feed known—whether manufactured or made at home.

Feed it alongside of any other mash you may select and the results will amaze you. It is the cheapest in price because it produces more eggs.

It must be the main feed of the day and kept constantly before the fowls in the Vitality Self Feeder—nothing mixed with it, and nothing fed besides Four-O-Clock Scratch Grains as an evening meal at four o'clock. To accomplish the most in production, a hen must consume a greater amount of mash than grain; in fact, twice as much mash. Therefore, see to it that the mash hoppers are always full and that nothing else is used that will "stall" the hens.

Back of These Feeds

1922

Be sure the signature of Albert Angell, Jr., is on every sack of Four-O-Clock Scratch Grains, with our guarantee of absolute satisfaction when fed according to directions.

The highest quality scratch grains made.

Contains no barley, oats or waste. Every particle of every ingredient is consumed by the fowls, because there is just the right quantity of the best quality.

No other scratch feed will answer the purpose.

GUARANTEED ANALYSIS

Horticulture for Poultry Keepers

Conducted by Thos. F. Pigg, Iowa Falls, Iowa.

Will you be so kind to let me know the address of some magazine or journal that deals with horticulture? I am buying the Garden Magazine, but I would like to know of some other publication especially devoted to trees, Mexico. M. Cananra.

The American Fruit Grower, State-Lake Bldg., Chicago, Ill., will be of service to you.

* * *

Kindly inform me as to when, how and where to plant peach seed to get results. I am thinking of putting out enough peach seed to plant a two acre orchard. I am not able to buy many trees and have no ground ready for trees so thought I would put out the seed. Will they bear true to variety and size when planted and grown from seed? Can I plant them in hot beds or rows? Louisiana.

J. E. Noble.

Peach tree derived from pits do not come true to name. Plant pits in fall or spring. In the summer following bud each tree to the variety you desire. Plant pits in nursery rows. After budding plant trees permanently the following season.

* * *

1. Can you advise me as to a choice between Oceana County, Michigan and Eau Claire County, Wisconsin? 2. Is the Michigan soil good for fruit and general farming? 3. Do you consider the "Twin Cities" market better than market near Oceana County? 4. The Eau Claire soil is a fine sandy loam with good orchard cites. Is not this favorable to fruit growing? 5. What fruits would you plant in a 30 acre orchard? 6. Are plums profitable? 7. I thought perhaps apples, plums and cherries would be O. K. 8. Can you recommend any varieties of pears for this section? Also do you think small fruits profitable if grown here and would it pay to ship to the "Twin Cities," 1,100 miles away? I know a fruit man who says Western Wisconsin in the St. Paul vicinity, is way ahead of Michigan for fruit. He says Michigan soils are poor and must be fertilized and that the Chicago and lake markets are generally glutted. Wisconsin.

V. Porter.

1. Either section is all right. For many reasons I would prefer the Michigan section in the county you named. However, this is but a personal choice. There is some truth in the statement of your friend that the Chicago market to which Michigan growers largely ship, is very often overstocked with fruit. In

fact, it is too often overstocked. 2. The soil and climate in Oceana county, Michigan, are particularly favorable to profitable fruit growing, and the most favorable in the state. 3. For small fruits the "Twin Cities" market is best. 4. Yes. 5. Would plant largely of apples; Delicious, Northern Spy, Wealthy and Northwestern Greening. Would plant 10 acres to raspberries, currants and gooseberries. 6. Would not attempt commercial production of plums. Don't do it. 7. Cherries are profitable but would prefer planting to apples and small fruit. 8. Do not attempt pear growing. Leave that to the other fellow. 9. Soil in either place you name must be annually fertilized for best fruit production.

* * *

I received a letter from a gentleman in Wisconsin asking about the planting of a commercial apple orchard near Hot Springs, Arkansas. Theo. Hewes on his "Mountain View Farm" near Hot Springs, is trying out various varieties of apples and other fruits. I asked Theodore for advice. He wrote as follows in his own interesting way:

In regard to the questions on horticulture submitted a few days ago will say: I am not well enough posted to answer these questions. I am on one farm and I am working it for all it is worth and I am uncertain about this small tract of land, and to try to tell any one about the general run of things in this part of state would be guessing only. I am leaving here early in July to visit an apple orchard of 25 acres located about 30 miles from me that is not fruiting. I think I know without going what the trouble is, but want to be sure. I am also going to Highland to look over the largest peach orchard in this country and am expecting to write up this trip for some good paper.

The best posted man I have had on my farm and one that makes his living by selling trees, says his company is not trying to sell apples in this district as there is not sufficient lime in the soil. I asked him to look over my new orchard and he came in after inspection and asked how I got such growth. He said: "Your trees have made an average growth of more than 18 inches this spring. (He was here the 10th of June.) What did you do to them?" I told him I had used lime last fall and had another barrel air slacking for this year. He said: "You

Whether you want pullets, cockerels or mature stock it will pay you to get our catalog and prices. Elliott Poultry Farm, R. No. 7, Box No. 87, Mansfield, Ohio.

have solved the problem and that is all that is lacking to make an apple orchard." I says, wait a minute, old man, there is a lot besides lime and I don't want you to go out quoting me or this orchard until I know a lot more than I do now.

I think I know what the trouble is but I don't know for sure, but I will know in five years from now if the Lord lets me live that long.

There are other things besides lime missing in this soil. And there are several things missing in the air that must be changed as well.

A peach tree in this country is a glutton and you can't feed it too much; you can grow one right in a manure bed and it will grow like rag weed. Apparently God made this country for pitted fruit and grapes; as the peaches, plums and grapes are the best I ever saw grow. Cherries do well, but you have to set up nights with the trees to get the root growth to compare with the top growth; the ground gets so hard they get root bound, and if you don't watch them they will double back over the same ground in order to work in loose soil. Within the past week I have worked with a grubbing hoe in 98 degrees of heat in order to loosen ground for root expansion, and you know a man loves a tree when he does that.

I have an old McIntosh seedling peach that was on the place when I bought it. It is growing on the side of a bank that you can hardly climb up. The cows had eaten the top and broken off most of the limbs, but I worked around it and got the top to spread out a little and this year it fruited. If you know anything of this tree you know they are about half dwarf; they never get big, but never in my life have I ever seen as much peach fruit on the same spread of limbs. They are just ripening now and the limbs are lying flat on the ground with their load, as this tree spread right at the ground. I have been feeding that tree now for a week. I cleared all the grass and weeds from under it, scooped out a hole about four feet above it on the bank, and put in a bucket full of fresh horse manure, then I turned the water in on this manure and kept adding water until the ground would take no more, and every evening I add five gallons more water to that tree. The peaches have doubled in size and the new wood is showing at the end of every limb. As this is a dependable seedling I shall plant all the seed, for it is a fact that a seedling peach will out grow, out last, and out fruit a budded tree. Well, I must wind up here and get to work.

* * *

Kindly inform me of a way to rid my gardens of worms as my garden, every morning, is like a sieve full of holes.

Illinois.

K. C. Kaue.

Do not attempt to rid your ground of the earth worms. They are useful and absolutely necessary to plant production. Without these and other soil worms we could not garden successfully.

* * *

I have been reading the Journal ever since I kept chickens, that is 6 years now. I bought 5 acres of land 11 miles from Detroit and I want to put out a orchard and berries of all kinds. I come to you for advice. This is what I want to know. Apples are good sellers in the Detroit market. I thought to put out 25 Steel Reds, 25 King, 25 Spy, 25 Jonathan, 25 Stark Delicious and also 10 crab apple, but I don't know what kind is the best; also 50 peaches, 25 cherries and pears, 25 Bartlett's, 2,000 plants of strawberries, but what kind is the best early and late? Also 1,000 grapes and also early apples; what kind? Is it too late to plant strawberries now? Where can I get these plants? This soil is a clay loam. It is a yellowish gray.

Michigan.

Frank J. Zeck.

Your selection of apples is a good one. Plant Florence crab apples. They are best of all. The Montmorency is the most profitable cherry. Advise you not to attempt commercial growing of pears. The pear blight will make such an attempt unprofitable. Plant Senator, Havenland, Sample and Brandywine strawberries. You will find the Concord the best black grape and the Moore's Diamond the best white grape. It is not too late to plant for this season.

Black Javas

Editor A. P. J.: If you will give this article space and help the maintenance of this old breed, I as well as others will be greatly appreciative.

I fully realize that the Giant breeders have worked hard, and for the good of the industry, with a breed which is proving of high value and worthy of recognition, and I personally believe the standard committee should look into this particular case well before turning them down.

I have not learned just what the Giant standard is to call for, but I understand it is typical of the Java, except for weight. Now, to be fair with all concerned, I believe there should be some other outstanding feature to safeguard against the standards for the two breeds conflicting. It is very common to find a smaller Giant or a larger Java than the standard calls for. I have known of Java cocks weighing 11 pounds, while Giants run lower at times. In such cases conflict is possible. The build of the two is somewhat different, but they would conflict in this respect, for there is always variation in every breed from the one ideal standard type. I truly believe that there should be some other outstanding feature of distinction, such as a different kind of comb or different colored shanks. I also maintain that the R. I. Whites and W. Rocks should be more distinctive. Let us think of all concerned.

Mr. Meloney states that if the Giants are refused admittance due to their resemblance to the Java there is a better reason for admitting them, which is the fact that they are to be of great value in the development of American poultry husbandry. To a certain extent this is true. On the other hand, I believe the old fashioned Black Javas should be protected, as they are an old breed (and hard to beat), which have played a prominent role in producing some modern breeds. They are really one of the old cornerstones of the poultry industry, and those cornerstones should not be knocked out from under the industry. The fact that the Java has become a rare breed is due to a big extent to the originating of new breeds, which for a time become very popular. Some continue so, but like a new dance, they take for a while, then some stay and some go. Many try them when they are new and in doing so the old breeds come to a standstill, or perhaps fall back for a while, but in time become popular again. This is surely true of the Javas. It is a fact that the Java interest is growing rather than decreasing. In my opinion the Giant breeders are really Java enthusiasts, who are taking a new name and a new weight. Why not change the standard weight of the Java, breeding larger ones? Then the Giant and Java workers could unite to push the Javas. I believe, however, that when we increase the weights the laying qualities are lessened. For this reason I believe Javas make better layers than Giants and mature more quickly.

As for Javas decreasing in demand, I will say I have had orders from far and near in the United States and with no advertising. I cannot say that of any other breed. For this reason, I say they are not losing in demand. The public wants them. I am sure any fellow breeding good Javas will have more calls than he can fill. There is a good interest in Javas, but they need a young fellow to go ahead and put them where they belong. There surely is more demand than output by a good lot, and still growing. That is why you see so few Java ads. The rich, yellow flesh cannot be beat, and their laying qualities, as Henry C. Turck says, "They are king of the Winter layers;" and in development, the Giants being coarser boned, can never develop so quickly in the ordinary flock. Java men should come out and speak for their breed.

As far as the exhibit at the Madison Square Garden Show of 1922 is concerned, will say that Giants were well represented, while Javas were not, but that does not prove that Java interest is lacking, for a few breeders could club together and make a big showing of any breed and it could still not be as good a breed as some other, or as valuable. The question was asked, "Which breed was of most value to the management of the New York show?" In 1922 the Giants were of the most value, but possibly, by incentive for exhibition for the Giant breeders than for the Java men. Then, too, Javas are not raised on a large scale or business basis, and when one shows at the Madison Square show he has got to do it with the advertising point in view in order to protect his expenses. As for Javas they sell without much advertising, so why should Java breeders show where there is a big expense and no incentive for them? The Maine State Show at Portland, Me., where a big show was held (but not of course in the class with the Garden) we had 15 Javas and 2 Giants and this is not a good example; neither do I think it is in the case of the Garden, for there are

"No Lice on Me!"

AFTER numerous tests with different materials for destroying lice on poultry, the U. S. Department of Agriculture found nothing so effective as

Sodium Fluorid

The method of using and the remarkable results obtained are published in U. S. Dept. of Agriculture Bulletin 801.

Clemson Agri. College, So. Carolina, says in Ext. Bulletin 53, "It is unquestionably the best louse killer we have tried." Twenty-one other State Exp. Stations say the same.

R. T. Parkhurst, Head Dept. of Poultry Husbandry, Idaho Agri. Exp. Station, says: "It (Ivo-San Sodium Fluorid) is a very satisfactory control measure for lice. For the price, I consider your product superior to any I have had the opportunity to handle."

Andrew Small, Rock Springs, Wyoming, says: "I used Sodium Fluorid on my chickens three years ago and haven't had a louse on my chickens since."

IVO-SAN SODIUM FLUORID

is air-floated, fine as flour, of highest grade, and unadulterated. Costs only 7/10c per fowl. Very effective too, against cockroaches, water bugs, ants, plant lice, and lice on live stock. Two pound can, \$1.00; 4 pound can, \$1.75; 8 pound can, \$3.00, postage prepaid to U. S. Points. 10c per pound additional to Canada, Cuba or Mexico. Copy U. S. Dept. Agri. Bulletin 801 with each order.

Orders filled on day received. If you want to test Ivo-San Sodium Fluorid before buying, write for free sample. Send today—solve your lice problem.

Queen Incubators
are built in sizes
70 egg to 1000 egg

Queen Incubators

(48)
400 to 1000 EGG CAPACITY

These larger Queens are for people who want to speed up production. They are wonderful machines—you can trust them with your big hatches. We have sold 275 of these to one man at one time.

Queen larger Incubators, like the small ones, are noted for their large hatches of **Strong, Healthy Chicks That Live and Grow**

The Queen is built of genuine Redwood, which does not absorb the odor from hatching eggs, to weaken later hatches. The Queen hot water system prevents the eggs from drying out and provides ample moisture for the hatching chick.

The Queen is the only Incubator that carries out the double Redwood wall construction all around, and provides a double wall front, in the way of two separate doors.

Queen Incubators and Brooders are sold by the best dealers in poultry supplies in almost every town in the United States. If your dealer can't show you a Queen, write us and we shall tell you where to find one. *Free book on Queen Incubators and Brooders. Ask for it.*

QUEEN INCUBATOR COMPANY, Lincoln, Neb.

Buff Minorcas

Their future is assured since the A. P. A. Convention increased their weights. Those who will look ahead and get a good start in Buff Minorcas will be sure laying the foundation for a real money making business. Can furnish outstanding old or young stock to win anywhere.

If you want big Buff Minorcas with Standard requirements, I have them. Command me.

Dr. HESS & CLARK
Ashland Ohio

Sucrene Buttermilk Egg Mash is rich in "vitamines"—the elements that develop healthy, vigorous hens and double the egg production they give on ordinary grain feed.

Contains 18% protein, the nutrient which hens need to make whites of eggs, and to restore bodily vigor after the moult. Sucrene Buttermilk Egg Mash is invaluable for moulting hens. It keeps up the hens' vitality enabling them to grow an entire new coat of feathers and return to full laying condition in the shortest possible time. You can always depend on a big crop of eggs when you feed Sucrene Buttermilk Egg Mash. If your dealer cannot supply you please write us. Do not accept any substitute.

many interested Java folks who have never heard of the Maine State Show; neither can they afford to show at the Garden. I believe that there are as many Java enthusiasts as Giant men, but at the present the Giant men are more active. My question is, was the incentive greater at the Garden for the Giants and was this particular show planned to be a Giant show rather than a Java?

As for admitting Giants to the Standard, this article is not meant to prevent their admittance, but to protect the Java in such a way that all will have a square deal. After Java has played such an important part in the development of good poultry and the help it has been to the American poultry industry, it is hardly fair to let it run out or be pushed out. The Java surely has many good points, and though no breed is perfect, it comes well up on the list, even though it is not receiving public attention at present. It has been neglected for the newer breeds. I have many calls from people who have kept Javas in years back and after trying others, decide to find some Javas and see if they are as good as they used to be. They are, so let's keep them.

I trust all concerned will get together with the right spirit and compromise. Both breeds can exist and good results realized if the right spirit and methods are adopted. Giant breeders, what do you think? We Java breeders and enthusiasts are believing your intentions are good and sound, wanting to see everything satisfactory to all concerned.

Remember, the Java weights: Cock 9½, cockerel 8½, hen 7½ and pullet 6½ pounds, being hardy, early maturing, quiet, good mothers (but not troublesome setters), unusual layers (of brown eggs), with extremely yellow flesh, make them attractive, and face to face with a big future. When dressed they make a very attractive appearance, are as large as the average family calls for, and being smaller than the Giants, make better layers, for as a rule, extremely large hens lack the best laying qualities.

Maine.

Robie Whitney.

Why Neglect Our Old Breeds?

By E. H. Hoffman

It has often occurred to me that many of our old and worthy breeds are being neglected and the poultry business is becoming top heavy because the majority of the poultry fanciers seem to be breeding only a few of the more popular varieties. In the face of this fact new breeds and new varieties are constantly asking for admission to the American Standard and it is a question in my mind if these new comers will not be in the same class with many of the others, and after their boom is over and they, too, will be in the neglected class. It seems to me that the Standard contains many breeds and varieties that have distinct features of either type or color that should appeal to more of the American fanciers. They are all breeds worthy of consideration and deserve a place among the more popular varieties.

Years back the Asiatic class, comprising the Light and Dark Brahmas, Buff and Partridge Cochins and Black Langshans held prominent positions among the list of popular breeds, but they are all cast aside and it is a novelty to see a good class of any of them today in the average poultry show. It cannot be because they have no merit, not because they are not attractive exhibition birds, but there is something that has put them in the background much to the advantage of newer breeds. Perhaps it is the feathered shanks that does not appeal to the average fancier. The Brahmas and the Langshans are large table fowls and average layers for birds of that weight.

Be that as it may we have the same plumage on other varieties and even then the latter are not among the list of popular varieties. By that I mean the beautiful plumage of the Light Brahma has been transferred to the Plymouth Rock and the Wyandotte type in the shape of Columbian Rocks and Columbian Wyandottes. Should the trouble be as I stated that it is the feathering on the shanks that has been the cause of neglecting the Light Brahma, would it not stand to reason that fanciers admiring the Light Brahma plumage would take up the Columbians? The same can be said of the Dark Brahma, the identical plumage of which has been transferred to the Plymouth Rock and the Wyandotte in the Silver Penciled varieties of these two breeds. In my estimation there is no color scheme that is more beautiful than that of the Columbians and the Silver Penciled varieties, but still the American fancier does not seem to take to them and as a result all the varieties with this attractive color are in the class of neglected breeds.

The Cochins have never been classed with either the Brahmas or the Langshans as a commercial fowl, being less productive as

layers. However the Partridge and Buff Cochins have very attractive plumage and, like in the case of the Brahmas, their plumage has been transferred to other breeds. In the Buffs we find Rocks, Wyandottes, Leghorns, Orpingtons and Minorcas. Some of those mentioned are more widely bred, but nevertheless the Buff Cochins are dormant. The Partridge varieties, including the Rocks and the Wyandottes, are somewhat ahead of others in popularity, but even at that they cannot be classed among the real popular ones. At many of the shows, however, there are large classes of good Partridge Wyandottes as well as Rocks, and the same can be said of the Buff varieties, but that does not explain why the original breeds producing these colors, namely, the Brahmas and the Cochins, should have dropped away out of sight.

Besides the varieties that I have mentioned we have many others that were once widely bred but which have been neglected without any justification. I remember when Black Javas were among the large classes in many of the shows and they were considered one of the best of the general purpose breeds. Then there were the different varieties of Hamburgs, especially the Silver Spangled. No doubt this is one of the fanciers' favorites, but still they are uncommon and few seem to breed them. The Polish varieties are very attractive, especially the White Crested Blacks, with their graceful carriage, greenish black plumage and the beautiful white crest. For the real fancier, who takes pleasure in having only a few birds and has a place to give them range on a grass lawn, the White Crested Black Polish have no rivals.

Many of these breeds just mentioned have been discarded, no doubt, because of the introduction of newer breeds and varieties. When the Rhode Island Reds were first admitted to the Standard there was immediately a demand for them and there was a reason for it. The Reds had qualities that made them popular. They were good layers as well as a table fowl and in addition to that they were something different in color. While they were called reds at that time they were nothing more than dark reddish buffs, but as time went on the breeders who took them up improved them until today they have that beautiful, rich red color that has so many admirers. This was one of the new breeds that cut into the older ones, because of their value as a general purpose bird with a very attractive plumage.

Another one of the breeds that is unusually popular and more so than its different colored cousins, is the Single Comb White Leghorn. Here, again, we have a variety that not only stands high as an egg producer, but it has been so scientifically bred that it is ahead of all other varieties of Leghorns with reference to type. The Single Comb Browns are now being widely bred, but the Buffs and Blacks and the Rose Comb varieties are less popular, not because they have no merit, but for some reason they cannot keep pace with the Whites and Browns.

It has been a question in my mind whether the new breeds that are asking for admission to the Standard will not be in the same class with some of those I have mentioned, but of course that remains to be seen. With the breeds we already have it seems that there is a sufficient variety of type and color to give every fancier what he desires and I would like to see some of the older worthy breeds taken up and developed into popular breeds because they deserve it.

A Tent Hen House

Now, while army tents are to be had at such reasonable prices, is the time to try wintering the farm flock in a tent. One Missouri man through necessity, found it to be quite a success. In fact, so much so that he is planning to use a tent again this winter in preference to a good hen house. After keeping his White Leghorns in a tent during the coldest weather last winter he moved them into a hen house which resulted in frozen combs for quite a number of them.

When wintering hens in a tent they can be kept up all the time and still get plenty of fresh air, which is so essential to a healthy flock—and at the same time the tent will be free from cold drafts which are so injurious to hens and which are more or less present in all ordinary hen houses.

The tent is erected in the usual way. Then boards are placed around the base and the bottom of the tent nailed to them. This keeps out all drafts, snow and rain. The roosts and nests are arranged to suit the individual and a deep straw litter is kept on the ground all the time. The sunlight filtering through the light colored tent makes it much lighter than in an ordinary hen house. Consequently, the hens scratch and sing all day long, which, as all successful poultrymen know, makes for a larger egg production. Mary E. Jeans.

Brood Your Chicks 30 Days FREE!

1,500 Chicks around one stove

Also small size stoves. No hovers to bother about. No gas, no fumes, no wicks, no smoke. All bother and worry gone. Losses reduced to a minimum.

Use this wonderful new Simplex Brooder Stove in your own brooder house 30 days absolutely free. Write for free Brooder Book fully explaining offer. Try the stove under all conditions. Make any test you know of. Then, at the end of 30 days, if you are not delighted send it back and we'll cheerfully refund your money. You alone are the judge.

Turns Losses to Profits

This wonderful new brooder will raise 50 per cent more of your chicks than you have been able to raise by old-fashioned methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by extra money it makes.

Saves Labor and Expense The Simplex Brooder Stove means one-tenth as much work—costs one-fourth as much to operate as any other system. It is self-regulating—needs no watching—eliminates all worry. Try it 30 days free.

Send for Free Brooder Book

Send today for valuable book that tells how to "Increase your Profits by Decreasing Mortality"—absolutely free. It tells how to solve your brooding problems. It tells how to save the chicks that you have seen content to lose every year through disease and faulty brooding—how to make twice as much money from your poultry. Also catalogue and complete details of the wonderful Simplex Brooder Stove and our 30-day free trial offer. Sent to you absolutely free. Send today.

WASHINGTON, D. C.

Quality Eggs Pay

By T. S. Townsley.

Many poultry keepers attempt to justify their careless methods of handling eggs by pointing out that in most markets eggs are bought on the case count or ungraded basis. By this system all eggs, good, bad and indifferent, are purchased at the same price. The result is that the price for all eggs is low because the buyer must protect himself against the losses from low grade eggs. This system offers very little encouragement to the farmer to produce good eggs because he gets no pay for his extra care. Under such conditions pride in his product and a sense of responsibility to the consumer are about the only incentive for trying to produce infertile, clean, fresh, well graded eggs.

Producers who are offering quality eggs for sale can often interest the local dealer in paying a few cents above market quotations by pointing out the superior value of their eggs over the ordinary run. If the local buyer will not make satisfactory adjustment for quality, it is usually possible for the producer to find a satisfactory outlet for his quality eggs. In many localities hotels, restaurants, soft drink parlors, and dealers in fancy groceries are glad to pay a few cents extra for eggs that are dependable. If a good market cannot be found around home the producer has the opportunity of shipping to commission dealers in the eastern markets. New York and Boston will always pay a good price for quality eggs during the Summer months; and for the egg producer who can ship a 30 dozen case at intervals of not more than five or six days, it is profitable to send quality eggs by express during the Summer and Fall months to the eastern markets.

White eggs should be sent to New York and brown eggs to Boston. The State Department of Markets at Albany, New York, issues a list of New York City commission dealers who are under state bond, and the Boston Chamber of Commerce furnishes a list of reliable commission men in that city to persons who are interested in shipping direct.

The most profit can be realized in shipping to eastern firms by carefully grading the eggs. The New York market wants eggs that are chalk white, clean, fresh and good sized. The Boston market wants brown-shelled eggs and the darker the color the better the market.

In packing eggs for express shipment new cases must be used and it is advisable to use six wrapped excelsior cushions to each case, placing cushions at the bottom and at the top of the case and the extra cushion being placed beneath the second layer of eggs from the top.

Keeping Up Egg Quality.

The old hen who cackles so proudly to advertise the marvelous food product she has created when she lays a clean, fresh egg would hang her head in shame if she could visit an egg candling room during the Summer months and see the deplorable condition in which a large per cent of the eggs reach the market. No doubt the industrious biddy who exerts every effort to produce a large number of nature's choicest food morsels would feel that her efforts were but little appreciated if she could observe the careless manner in which her precious products are handled.

To see the egg which at the time it was laid was capable either of providing an article of food nourishing alike to invalids or athletes, or if given the proper conditions would give life to a perfectly formed downy chick, descend to the low degree of being fit only for hog feed or use in tanning, is distressing enough to affect even a mud hen. No accurate estimate can be made of the losses caused to the poultry industry by careless methods of handling eggs during the hot season. Investigations made by the United States Department of Agriculture indicate that one egg out of every six is unfit for food before it reaches the consumer, but no figures are available to show the effect of the decrease consumption which results from the poor quality of eggs reaching the market during the Summer and early Fall.

The hen does her best to make the poultry business always good by putting out a quality product in an attractive package, and the individual hen is in no way responsible for the deterioration of the product.

Investigations indicate that the owner of a hen is the person chiefly responsible for the enormous leak in the poultry business caused by egg spoilage. A certain amount of blame for poor quality eggs must be laid at the doors of the egg dealers, but it is generally agreed that dealers as a class are making more rapid progress in maintaining egg quality than are the producers, who ought to be primarily interested in the subject.

By far the largest part of the Summer loss is found in fertile eggs. A fertile egg is one which if given the proper heat is capable of producing a chick. This class of eggs is very

Artificial Light

Makes a greater net profit at a lower cost than anything else you can buy. Hens must have 12 to 14 hours' daylight to produce high price winter eggs. PORTABLE 300 CANDLE-POWER LIGHT.—Makes brighter, whiter, more brilliant light than electricity. Burns kerosene or gasoline. Costs less than one-half cent per hour. No odor. No smoke. No wick to trim. No chimney to clean. Storm, rain, sleet and snow proof. Easy to carry, hang up, or place anywhere. Made of heavy metal, nickel plated. Shines like mirror. Has special reflector top; throws light down equally all over room. Automatic tip cleaner prevents clogging of carbon or dust from fowl's scratching. Can adjust light high or low. One light sufficient for 100 fowls, or house 18 by 18 feet. This is the only light of its kind on the market that will give you absolute satisfaction. No other lantern gives such a uniform distribution of light; and that is what counts in the hen house. Give your fowls 14 hours daylight. Keep this light burning in your poultry house morning and night. Nothing will pay you better. Write for Free circular and price list. It will pay you to answer this ad today.

Willomine Farm
Fishel White Plymouth Rocks
R. F. D. Box 3, Hillsboro, Ohio
April 6, 1922.
American Scientific Laboratories, Inc.,
Chicago, Ill.

Gentlemen: Last autumn we vaccinated all our breeding birds with A. S. L. Avian Mixed Bacterin and have not had a single case of Roup, Diphtheria, or Cholera this season. Our eggs hatched better than ever before; and we have had the best chicks ever obtained.

Last fall we purchased a valuable pen; the cock came through with a miserable case of canker. We first treated him with every known remedy without results and were about to give him up. When we vaccinated, giving him a double dose, he came around in good shape and made us a splendid bird. We have also used your Galli-Cura on our chicks without a single case of Diarrhea and feel that we cannot afford to raise poultry without the A. S. L. products which we are very glad to recommend. Now we advertise immunized stock only.

Respectfully,
Willomine Farm,
F. B. Rhoades, Mgr.

"Viking" Strain Rhode Island Whites

Just Admitted to the Standard

The World's Greatest Profit Producers. Read This:

1—They LAY MORE EGGS than any other breed of chickens!

Put them side by side with ANY other flock of chickens, such as Leghorns, Anconas, Plymouth Rocks, Reds, Orpingtons, Wyandottes, etc., and the Rhode Island Whites positively will lay MORE eggs than ANY of them. They are, moreover, wonderful Winter Layers, when eggs are highest in price. RHODE ISLAND WHITES ARE MAKING GREATER AVERAGE LAYING RECORDS IN THE LEADING CONTESTS OF AMERICA THAN ANY OTHER BREED OF POULTRY.

2—They are as good market chickens as Plymouth Rocks!

About the same weight as Plymouth Rocks, they have rich, golden yellow skin, juicy, tender meat and plenty of it—a real delicacy on the table. They command the very highest prices as Market Fowl.

4—They are quick maturing, easily raised.

EASILY CONFINED IN LOW FENCES, IN FACT, HAVE MORE GOOD QUALITIES THAN ANY OTHER CHICKENS THUS FAR PRODUCED! This broad and sweeping statement is proven and backed by every well-kept flock of Rhode Island Whites in the country.

3—They are beautiful, prize-winning show birds.

Just picture to yourself, dear reader, flocks of chickens as pure white as the driven snow, with bright red heads, golden yellow beaks and legs, stylish and proud, with nice, full bodies and elegant finish. Ah! they are indeed beauties!

5—Very special introductory prices RIGHT NOW!

In order to introduce these Wonder Chickens as quickly as possible into many different localities, I am giving AMAZING introductory prices on first orders. Remember, THIS IS THE INTERNATIONAL HEADQUARTERS FOR THE BEST R. I. WHITES IN THE WORLD.

Investigate this wonder breed! It will surely repay you! Mail this coupon today! ➔

PEACOCK'S POULTRY YARDS

Box 16 WINNEBAGO, ILL.

hard to handle in hot weather without heavy losses. Marketing conditions throughout the heaviest egg producing sections are such that considerable time is required to get the eggs from the nest on the farm to the cold storage plant in the city. It is during this interval that the loss occurs. A fertile egg will incubate at any temperature above 68 degrees and one held at 85 to 90 degrees for three days will show as much development as for one day under a setting hen, while one held at 104 to 110 degrees for one day would show as much chick growth as for three days under a hen. During the Summer on many farms it is impossible to find a room that will be cool enough to prevent fertile eggs from incubating. When the eggs are held on the farm for a week or more at Summer temperatures, considerable chick development will take place in fertile eggs. Investigations show that at least two-thirds of the egg losses occur on the farm, but the huckster wagon, the country store and the hot freight and express car also cause heavy losses in fertile eggs. The roosters in the flock are responsible for all the losses by chick development and for most of the loss from rot. The remedy is simple. Get the roosters out of the flock before hot weather sets in. If this is done the loss in bad eggs will be less than half as great.

The rooster eats high priced feed during the summer and lowers the quality of the eggs without producing any benefit. He stands indicted as a foe to conservation and should be "canned" out of the flock. To sell, kill, or confine all roosters as soon as the breeding season is past is the greatest single move toward saving the Summer egg. All roosters which are not to be used another season should be sold or killed. Those valuable enough to serve the next breeding season may be confined to a small yard without any harm to the roosters. With some breeds the early hatched cockerels may develop rapidly enough to fertilize eggs before the end of the hot season. To prevent this, all cockerels should be disposed of before they reach sexual maturity or should be raised at sufficient distance from the laying hens that they do not mingle with them. This gives the young male a better chance to develop and prevents fertile eggs.

Other Causes of Loss.

Aside from the losses resulting from the sale of fertile eggs, a further preventable loss is caused by cracked eggs, dirty eggs, shrunken eggs and bad flavored eggs.

Cracked or broken eggs are caused by thin shells and careless handling. The thin shelled egg can be largely prevented by giving the hens plenty of exercise and seeing that they are provided with a liberal supply of lime in the form of crushed oyster shell. Eggs are often broken in the nest either by the hen dropping them on to the bare nest bottom or by hens crowding in the nest. A nest should be provided for every six hens and the bottom be kept covered with straw or other nesting material to prevent these troubles. In gathering eggs a basket or bucket with some soft material in the bottom should be used. In packing eggs to be sent to market the bottom of the basket or box should be lined with some soft pad or the eggs should be packed in cases, using heavy new cardboard fillers with proper padding at the top and bottom of the case.

Dirty eggs spoil quickly due to the ease with which bacteria can pass through a dirty shell. Washing the eggs destroys the protective covering and causes them to spoil more readily. Special care should be used to reduce the number of dirty eggs by keeping the nests clean and the poultry yard dry. The straw in the nest should be changed as soon as it begins to soil the eggs and the nests should be closed at night to prevent the birds roosting in and fouling them. Dirty eggs are all right for immediate use but should be served at home instead of being sent to market.

Shrunken eggs are those showing a very large air cell. This results from heating or holding the eggs too long before marketing. A part of this loss comes from selling infertile eggs from the incubator. Allowing broody hens to sit on eggs several days before gathering also causes shrinkage. Holding the eggs to secure a full basket or crate or waiting for the price to go up is another cause of shrunken eggs. This loss can be prevented by gathering the eggs every day, by making sure that none from the incubator or setting hens is sold, by storing in a cool place and by sending the eggs to market regularly twice each week. A dry basement or a well ventilated cyclone cellar makes a satisfactory place to store eggs on the farm or they may be kept cool by placing them in a bucket and lowering them into a well.

Bad flavors in eggs result from mold, absorption of odors and improper feeding. A mold which develops when the eggs are kept in a damp, musty place imparts a bad flavor.

In the Southwest

M. S. Meals, Texas, writes to editor of A. P. J. as follows:

Being a subscriber of your journal and reading your articles each month, I have quite a lot of faith in your advice, and while your work and experience is in the north and eastern territories, where there is an entirely different climate, you may be familiar to some extent with our great southwest and your general knowledge would apply here, if not directly applicable to such a climate. None of your northern or eastern publications ever give any notice or attention, it seems, to us out here and to the possibilities of this great southwest, but of course the greater part of your territory and field of operation is in the north and east.

"Nevertheless, I find your journal very valuable, though many of the articles are confusing, and it is along this line that I desire to write you briefly. One thing I want to say for the poultry fraternity. They as a whole seem always glad and willing to give another interested in poultry the benefit of their advice and experience, not alone those of you who are always glad to give direct advice to a subscriber, but numerous others who have no compensation whatever. They seem to be a class almost within themselves, and this is one of the things that makes it of such interest to me. When you wrote me a personal letter by hand some months ago, it greatly impressed me, and revealed to me your desire to render assistance, even to the extent of personally writing me in the absence of a stenographer. I did not expect that of you, but it had a mighty good effect, and was appreciated.

"I shall appreciate your advice along some lines of great importance to me in making my plans. If you are not the one to whom I should write, then kindly refer my letter to the proper member of your staff of experts.

"What type of house do you prefer and what size? What, in your opinion, is the maximum number of layers that should be housed in one unit? Some experts I find recommend only 100 to the unit, with a separate and distinct house. Others 200 to 250. Others up to 500 or 750 in long laying houses, with divisions into units of 100 or 200. Townsley recommends the low gable roof for the southwest. Some claim the shed type the only practical house, others the monitor, etc. We do not have severe cold to contend with and fight here, but it is high winds, rainy springs, northerners in mid winter accompanied by rain, sleet or snow, with freezing weather, and quick changes. Often we have bright, really pleasant weather in mid winter. Twelve hours later, however, we may have cold, rain and sleet, followed again by pleasant bright weather, mud, slush, and dampness in yards and housing, with quite severe heat in summer.

"I find that writers are clamoring now for space. What would you consider the minimum space on which I could successfully raise, handle and manage a capacity of 2,000 layers, and the type of housing? This would include, of course, the raising of chicks, from hatching to laying, and necessitate the hatching of and partially raising at least 3,000 to 5,000 little chicks, to insure 2,000 layers capacity for winter housing. Should the little chicks be handled in small units and what would constitute a range. In fact, as to chickens, I'm at a loss to understand exactly what constitutes a range. Whether that means a small plot of cultivated ground 50x100, for illustration, to each 100 chicks or layers, or whether it means acreage with the entire flocks run together. Some make one claim, others another. Tell me, therefore, briefly, just what does constitute a range for poultry. It has been my experience that they would not wander very far from their housing. Any information you can give me will be appreciated. Particularly, do I want the advantage of your knowledge and experience as to what might be the minimum space in acreage on which I could successfully operate such a plant as referred to above."

The above letter was referred to A. F. Rolf, Louisiana, who answered the questions as follows:

"American Poultry Journal has asked me to answer your letter regarding housing and range conditions in the south.

"There is great diversity of opinion as to what constitutes the 'best' type of house for conditions such as you are working under. The fact is, that there are several types which give equal satisfaction. From my experience in this section, also in Oklahoma, and from observation in your own section of Texas, I am inclined to favor the simple, shed roof type of house. I use that style here with excellent results. I like the rear walls from five to five and a half feet high; front walls seven to seven and a half feet high. Dropping boards at rear (on north

Breed Feathered Symbols of American Gameness

The utmost in Game Fighting Fowls. "My Southern Guards, Cuban Muffs, Mugwumps, Hennies, and beautiful Marines" have measured steel with the best in all the world and are at the top today. Send for free circular.

ALFRED F. GRAHAM

CAMERON, N. C.

Tarbox's Silver Wyandottes (All American Strain) and Speckled Sussex

The two great general purpose breeds. Winners at America's leading shows. Stock both old and young ready for delivery after September 15th. A. & E. TARBOX, BOX A, YORKVILLE, ILLINOIS.

This SAMPLE Makes 2 GALLONS Dip and Disinfectant

We want you to try this new and better Coal Tar Disinfectant—the only one made in solid form—

Conkey's NOX Solidified Disinfectant

Just dissolve one little cube of Conkey's Nox in a gallon of warm water and you have a gallon of Disinfecting Solution all ready for use. You pay nothing for bottles, barrels or cans; pay no freight on heavy liquid; you have no leaking or breaking.

Destroys Lice, Mites, Ticks

In combating poultry mites and similar uses, Conkey's Nox is undoubtedly the most efficient coal tar preparation known to science at the present time. It should be used constantly for cleansing and disinfecting coops, nests, roosts, incubators, brooders, fountains, etc.

Use Conkey's Nox once and you will prefer it to any other form of Disinfectant, Exterminator or Germicide. Send 10c. coin or stamps, for sample package containing 2 cubes, for making 2 gallons. Circular free.

wall) located about 32 inches from floor. Open front, but with some way to close out any driving storms which may come on. Ordinarily burlap curtains, made by sewing together old bagging, hung loosely will keep out the storm sufficiently, although of course it is not so neat in looks as specially constructed screens.

"A house 16x100 feet will easily accommodate 500 layers under our climate conditions. (I am referring to Leghorns now, for you indicated 'layers.' If you have in mind the larger varieties, they will require more roost room and you might have to cut down the capacity of this house a little). Five hundred can be kept in one flock, for egg production, very satisfactorily. More can be kept together, with good results, except that a larger size house makes the work cumbersome.

"Of course, for breeding stock, you should have smaller houses and yards, for you will have to practice constructive, selective breeding if you are to attain your maximum efficiency. But, your reference being to laying stock, I will not touch on that point.

"For 2,000 layers I would recommend four houses, each 16x100 feet, each to handle 500 birds. I would advise at least two acres yard room for each of these houses, and three acres would be better still. The major portion of your chicks can be successfully handled in either coal or oil burning stove brooders which will accommodate 500 or more chicks in a flock. They should have yard room of, say, 1,500-2,000 square feet from time they are old enough to run out until they are some six weeks old, when they should have more. Of course, if acreage is available, it is more desirable to give them unlimited range, in a corn or sorghum field for example, as soon as they can get accustomed to it, and not have to move them to other quarters until nearly matured.

"Range means most anything a man has in mind when he says it, apparently. Free range should mean absolutely unrestricted access to as great an acreage as they would possibly use. Limited or restricted range should apply to a fenced in area, although this may include as much land as the birds require for best results and all they will economically use. But, the word has not hard and fast meaning as it is customarily used.

"For 2,000 laying hens, necessary breeding stock, and ground for raising young chicks (not figuring any surplus ground to be devoted to growing feed crops) I would want at least 12 to 15 acres, for myself. Of course, many do this on less acreage, and the land actually required is determined largely by the methods of management which are adopted."

Iodine for Internal Medication

It is generally agreed that most of the ills to which poultry are prone arise from infection in the digestive organs and alimentary system. Prevention, or disinfectant treatment when trouble is suspected, is the best method, writes J. M. Johnson in Poultry, England.

For the past two years, experiments have been carried out to endeavor to discover the easiest way of preventing and curing disease, which will be within the scope and means of the smallest back-yarder as well as the largest commercial poultryman. On the small poultry farm managed by the writer and his wife, experiments have been carried out and confirmed by application to other cases in the neighborhood.

The attention of the experimenter was drawn to the value of iodine by the experience gained as a dispenser of medicine for over twenty years in a large city in the Midlands, in hospitals and private practice.

After many trials the following solution was compounded:

Tincture of Iodine, minims, 20.

Oil of Cinnamon, minims, 5.

Oil of Eucalyptus, minims, 5.

Oil of Thyme, minims 5.

Glycerine, one teaspoonful.

Rectified Spirits to one ounce.

This mixture can easily be obtained from any reputable chemist at a small cost.

The solution is used as follows: As a general antiseptic and preventive of disease, twenty drops to be added to one pint of water and used instead of the fowls' ordinary drinking water. This will be found to be invaluable as a powerful non-poisonous internal antiseptic. Used once or twice weekly, it will keep away most poultry ills.

It is also extremely valuable if given as above to day-old chickens on arrival, and for the first two days. The oils and spirit act as a stimulant to the chickens, while the iodine cures or prevents pasty vent and diarrhea resulting from chills contracted during the journey. The full ordinary dose

is five drops of the solution in a teaspoonful of milk. In cases of roup, colds, and nasal troubles, the nostrils can be sponged over with the solution itself, or syringed out with a mixture of one pint of the solution to five of water. For diarrhea, bowel troubles, crop-binding, or any disease, one or two doses produce an immediate improvement.

After two years of experience, the writer has come to believe that these or similar methods of intestinal antiseptic treatment are the only successful means of obtaining freedom from disease among the flocks of poultry keepers, and backyarders in particular.

Intensive and semi-intensive methods of poultry keeping are not natural to the bird and while cleanliness and proper feeding are the first factors of success, occasions arise when some treatment must be resorted to. The remedy is one which all can try and judge for themselves.

The Poultry Breeder

The poultry breeder is the man who looks into the future and sees a perfect bird possessing all the qualities that one desires in his fowls, and then endeavors to propagate fowls which approximate the perfect visionary bird. In selecting the specimens which are to be mated together he gives close attention to the characters in which they most closely approach the quality of the ideal bird and duly considers those wherein they are farthest removed from the ideal, with the object of maintaining the good qualities they may have and improving the parts in which they fail.

But having in his mind at all times a picture of the ideal bird, the breeder has a definite object towards which to work and something with which to compare the product of each season's matings, thus to determine the degree of progress that has been made and which of the characters that have been most affected.

It is only through a process of comparison, selection and elimination that progress in breeding is made. But in applying this method each individual bird must be considered as a whole, otherwise a bird may be accepted on account of being unusually good in some particular point, and yet be so deficient in others as to be of no value whatever when placed in the breeding pen.

One demonstrates his ability or lack of ability by the skill with which he selects his breeding fowls. If he is so limited in his judgment that he can see only one or two qualities he has not the ability of a real breeder and will not succeed, for while he may, and probably will, succeed in getting those one or two qualities in a high degree of perfection, his fowls will be so lacking in all the other essentials as to be of little value.

The tendency to magnify the importance of some particular point and overlook all the others is the stumbling block over which many a would-be breeder has tripped and went down to failure. The man who breeds for an improved whole is the one who is accomplishing the most for the industry as well as himself.

The poultryman who is really breeding is aware of the fact that it is a comparatively easy task to develop one or two traits to a practically perfect state within a short time, but that is not the limit of his ambition. His goal is the production of the most perfect bird as a whole that it is possible to evolve, and not one that is perfect in one or two sections and decidedly defective in all the others.

Some people imagine themselves breeders merely because they practice line-breeding, or rather because they each season mate up birds that are closely related. Such a person will call attention to a collection of fowls in which size and vigor are greatly lacking, or in which some other serious defect such as crooked backs or knock knees is very prevalent, with the remark that there is a flock of birds which he has produced by strict line-breeding, apparently unable to see the deficiencies of his fowls and firm in the belief that he is adhering strictly to the laws of breeding simply because he is mating related birds. These people do not seem to realize that it is only when accompanied by the most careful and rigid selection that consanguineous matings produce desirable results.

Inbreeding is one of the surest and quickest ways to ruin a flock of fowls when one who has not yet learned the art of selection attempts to practice it.

The work and business of the real breeder is often conducted on a rather small scale, so far as numbers of birds produced and sales made are concerned, because birds meeting his requirements are not produced in large numbers, and he will not sell for breeding

Let Me Send You FREE on trial a Pair of Handsome Tortoise Shell Glasses

For many years people have been coming to me from every part of Chicago, on account of my wide reputation for supplying glasses that fit. I am now offering the benefit of this wide experience to people everywhere. No matter where you live, I positively guarantee to give you a perfect fit or there will be no charge whatever. I promise to send you a pair of glasses that will enable you to see perfectly and satisfy you in every way, or you will owe me nothing. They will protect your eyes, preventing eye strain and headache. They will enable you to read the smallest print, thread the finest needle, see far or near.

SEND NO MONEY

I will not accept a single penny of your money until you are satisfied and tell me so. Simply fill in and mail the coupon below, giving me the simple, easy information I ask for and I will send you a pair of my Extra Large Tortoise Shell Spectacles for you to wear, examine and inspect, for 10 days, in your own home. The glasses I send are not to be compared with any you have ever seen advertised. They are equal to spectacles being sold at retail at from \$12 to \$15 a pair. You will find them so scientifically ground as to enable you to see far or near, do the finest kind of work or read the very smallest print. These Extra Large Size Lenses, with Tortoise Shell Rims, are very becoming and your friends are sure to compliment you on your improved appearance. There are no "ifs" or "ands" about my liberal offer. I trust you absolutely. You are the sole judge. If they do not give you more real satisfaction than any glasses you have ever worn, you are not out a single penny. I ask you, could any offer be fairer?

SPECIAL THIS MONTH

If you send your order at once I will make you a present of a handsome Velvet-lined, Spring Back, Pocket Book Spectacle Case which you will be proud to own. Sign and mail the coupon NOW. purposes a fowl whose proper place is in the roasting pan. He does not look upon his customers merely as people from whom he is to take every cent that he possibly can, but regards them more in the nature of assistants who are lending support and encouragement to his efforts by purchasing his product, and in appreciation of the aid thus rendered, he delivers the very best value that he possibly can for the money they invest with him. It is this policy of the breeder that distinguishes him most clearly from the poultry raiser, or, perhaps, poultry huckster would be a more appropriate term.

Mo.

John Miller.

Report of the Convention of the American Poultry Association

(Continued from page 847)

bred industry augmented, the convention received the report of the Standard Revision Committee most favorably, and never before in the history of the A. P. A. was a committee so showered with compliments.

Action on New Breeds

M. L. Chapman and U. L. Meloney came to represent the Black Giants. They did not seek to flood the committee with argument. They granted that the committee had done the best it could under the circumstances and they sought a solution of the problem on some intelligent and scientific basis. Mr. Chapman stated that the Black Giant had white undercolor and that if the Committee would grant this light undercolor as a Standard requirement with solid black undercolor to the skin to disqualify, no Black Java would be able to win in the Black Giant class, and no good Giant could get by in the Java class. He said that real Giants did not have solid black undercolor, but when crossing was resorted to, and a Barred Plymouth Rock cross made, the pullets so bred had solid black undercolor and should be disqualified. The committee accepted this compromise on undercolor, and the Black Giants went into the Standard by the unanimous vote of the convention. They were given the heaviest weight of any breed in the Standard, the cocks being required to weigh 13 lbs., with a disqualifying weight of 11 lbs. There was some discussion on this point. It was pointed out that the Standard was being made for the whole United States and that some of the States had a shorter growing season than New Jersey, therefore, too high a Standard weight would be difficult to attain and would retard the popularity of the breed in the sections of the country where the summer season was short. The Giant breeders took the position that the weights requested were not excessive, that the fowl was capable of adapting itself to all conditions, and the heavy weights would work no hardship on its future popularity. The point was also made that the Light Brahma was the largest breed in the Standard, that it represented a half century of intelligent breeding, and that the Standard Committee should not only favor the new breed but should protect the old breed. This argument seemed to carry no weight with the convention, the consensus of opinion being that if the Giant breeders had an uncommonly big, rugged, meat breed, they were entitled to establish their Standard on the basis of legitimate weights, and if the Light Brahma men wanted equal weights it was up to them to move to increase the weights of their breed. Theo. Hewes suggested that it might be difficult to get greenish black plumage on the surface with any ashy white undercolor, and that the fluff would be very apt to be ashy colored. He added that Messrs. Chapman and Meloney had gentlemanly and courageously met the objections of the Standard Committee, and given the breed a distinctive character by accepting white undercolor and disqualifying for solid black to skin, and that he didn't want to drive too hard a bargain with this new breed which would have great possibilities under a normal and sensible Standard. Mr. Chapman thanked Mr. Hewes for his attitude, but assured the convention that he had and was able to produce a surface plumage on his Giants that was as rich and lustrous in green as that found on any other black variety.

Rose Comb Barred Plymouth Rocks were denied admittance to the Standard. The argument was that the single comb was a breed character of the Plymouth Rock breed and the rose comb was a breed character of the Wyandotte breed. It was pointed out that if the rose comb could be transferred to a Standard Plymouth Rock, the right could not be denied to put

Kills every Rat New Super-Virus!

Make Your Own Super-Virus At Home—Easy—Here's How.

There is now no need for paying \$1.00 an ounce or more for ready made rat virus, most of which may be salt water, agar or simple bouillon.

A new method of culturing and shipping now provides the genuine, live Danys Organisms unmixed with anything else. They stand shipping in any weather, and are effective until

used, up to 6 months. These organisms—germs—are harmless to handle. They affect only rats and other rodents, giving them a fatal disease that quickly wipes them out, young and old. The Danys Organisms are simply put into cool, sweet milk and then put on dry bread, oatmeal or other suitable bait.

Rats greedily devour bait so prepared. In a few days they are dead. Meantime, the diseased rats spread the Danys' Organisms, exposing other rats to the same disease. The same for mice and gophers. Yet it is harmless to people, to poultry and all animals except rodents.

A bottle containing 2,000 billions of Danys Organisms, costs only \$1.00 and makes 16 ounces of super-strength virus—16 times cheaper than other forms of rat virus; and 10 to 20 times more rat killing effectiveness per ounce, because of the greater virulence (deadliness) of the organisms, and the greater number of billions of organisms per ounce. Prepared at home, fresh, as used, this virus is therefore of the highest potency.

Send \$1.00 to the Hunter Laboratories, Dept. 128, Kansas City, Mo., or order C. O. D. for \$1.00 and postage. Use the Danys Organisms according to directions on bottle, and if not satisfied after three weeks, get back the dollar promptly. The experience of thousands of users proves this method best for rat destruction.—Advertisement.

a single comb on the Wyandotte, and we would soon have single and rose comb White Plymouth Rocks and rose and single comb White Wyandottes. It was stated that a petition for the admission of the Single Comb Silver Laced Plymouth Rock was already filed, and that in the history of this breed, the originator had plainly stated that the variety had been developed from single comb Silver Wyandotte sports. The convention overwhelmingly voted to deny admission to the Rose Comb Barred Rock. S. B. Wenger, originator of the variety, was in attendance. The old gentleman graciously accepted the defeat of his efforts. He was frankly disappointed but held no malice. He said that there were 400 breeders of Rose Comb Barred Rocks and they would be disappointed because the A. P. A. had accepted the money of their club for a life membership; that half a dozen of the breeders had individually joined the A. P. A.; and that they had gone ahead and presented the petition for the recognition of their variety, complying with all the requirements of the A. P. A. constitution covering the application of new breeds. Mr. Wenger, however, was equally ready to give full credit to the Standard Revision Committee for having done what they believed to be right in safeguarding the distinctiveness of breed type.

Single Comb Rhode Island Whites were denied admission to the Standard because of the similarity between this variety and the White Plymouth Rock. Grant M. Curtis held up his Standard, and, pointing to the illustrations of Rhode Island Reds and White Plymouth Rocks, said that there was as much difference between Red type and Rock type "as between a horse and a mule." The argument which prevailed was that there were always variations from the ideal and two breeds should not be admitted when the possibility of similarity was so great. On a roll call, 147 votes were cast, of which 94 were in favor of admitting, and 53 were opposed to admission. According to the constitution it requires a two-thirds vote to overrule the recommendation of the Standard Committee on the admission of new breeds. As the committee recommended against admitting S. C. Rhode Island Whites, it would have required 99 votes to have admitted the variety. The South was practically solid for Rhode Island Whites. The West was somewhat divided. It was the Eastern vote, small as it was, that helped to settle the issue on the S. C. Rhode Island Whites.

Rose Comb Rhode Island Whites were admitted to the Standard. The vote was 129 to 28 in their favor. Mrs. E. Alphonso of Missouri, secretary of the club, made a convincing argument in behalf of these fowls. She said that she had heard so much about politics in the A. P. A. that she had arrived in Knoxville a day ahead of the Standard Committee, and had patiently waited for this hour in which to speak in defense of her breed and in behalf of its breeders. Frank DeLancey made a patriotic speech, standing under the American flags which were used as decorations over the speaker's platform. Mr. DeLancey stated that the Rhode Island White Club had 1,100 members—"no, not 1,100 full members," continued DeLancey, "for 400 of those members are wounded soldiers from the battlefields of France who are now in the vocational schools of the Government, and who shall have to make their living from this breed. I do not believe the Standard Revision Committee knew this when they voted not to recommend the Rhode Island Whites." The Revision Committee asked the convention to base their vote on reason rather than sentiment, but if the convention wished to admit one variety of the R. I. Whites, it would seem best to admit the rose combed variety, as there was more difference between it and the White Wyandotte than between the Single Comb Rhode Island White and the White Plymouth Rock; moreover, the Revision Committee stated that the Rose Comb R. I. White was the original variety, as its originator, J. A. Jockey of Rhode Island, had crossed Partridge Cochins on a White Wyandotte male and had then used a Rose Comb White Leghorn male as a top cross. The convention voted in the Rose Comb Whites, and authorized that illustrations of them, also of Jersey Black Giants, be incorporated in the 1923 Standard.

In reporting the action of the convention on Rose Comb Whites, a daily paper in Knoxville, the Sentinel, said:

"By this time, the audience had been fanned into a white heat. Cries of 'question, question!' were emitted from a score of throats and every one seemed to be talking at once. Eighteen men were on the floor at one time, hurling defiant speeches at their opponents. Some one shouted out that the Canadian was trying to 'monopolize the floor.' Thomas

GAMBIER, OHIO

Make Your Pullets Lay All Winter

The large supply of vitamins and the tonic and health giving lactic acid in Semi-Solid Buttermilk prevent a moulting period of low egg production. The pullets fed Semi-Solid lay earlier and longer, and you get more eggs when they sell for the most money.

Semi-Solid Buttermilk is the poultryman's most valuable and useful feed, for it satisfies the requirements of the flock from brooding house through the laying pen.

Semi-Solid Buttermilk

is extensively used by leading poultrymen in every state. It is pure creamy buttermilk, pasteurized and condensed to point of maximum FEEDING VALUE per pound. Containers range from one gallon to 500 lbs., and meet the needs of every flock.

Write for FREE Book Today

Write us today for Prof. Harry R. Lewis' famous book, "Buttermilk Fed Chicks." Every poultryman reads and profits by the advice of this famous poultry expert. Send for your copy TODAY. Fill out the Coupon NOW.

The BUTTERMILK PRODUCERS, Inc.
4750 Sheridan Rd, Room 736, Chicago, Ill.

SPEAK TO YOUR DEALER: Ask your dealer about Semi-Solid. Most dealers who desire to co-operate with their customers handle Semi-Solid, for it gets and holds the trade of the leading farmers and poultrymen.

I Can Supply You with Winners for Your Show

The grandest flock that I have ever owned is maturing rapidly, and I can select just the bird or birds you will need to retain your supremacy at your show. Let me give you a quotation on just the bird you will need to win, rich in the blood lines of the string that made the sensational sweep at Washington last season.

ILLINOIS BAND & SUPPLY CO., Aurora, Illinois

Rigg, the president, called in vain for order. The raps of the gavel and his cries for order went unheeded by the audience that was fast becoming a mob. Cries of "question" continued and several suggested that a roll call be taken. This was decided upon and the convention became quiet once more.

"A roll call vote by states was taken and the result of the vote was 129 in favor of admitting the Rhode Island Whites with rose combs into the Standard of Perfection of the American Poultry Association, and 28 were against the adoption of the motion. Thus the motion was carried more than four to one, much to the gratification of the champions of the Rose Comb Rhode Island Whites."

Water Melon Party

After this strenuous session delegates stepped out from the building and under the forest trees of the park, were served ice cold watermelon. Riverside Poultry Farm, of which Judge H. A. Pickett is manager, brought over 50 big, ripe, luscious red melons that had been in cold storage long enough to be thoroughly chilled. How the men, women and children did enjoy those melons!

Of the breeds and varieties recommended dropped by the Standard Committee, the Rose Comb Buff Leghorns, Red Pyle Leghorns, Black Rhinelanders and Missouri White Fluffs were declared obsolete by the convention and will be omitted from the 1923 Standard. Silver Leghorns were declared to have single combs only. Slate Turkeys will remain in the Standard.

A motion was offered by B. E. Adams, South Carolina, that when a breed or variety applies for admission to the Standard the application shall be accompanied by a check for \$500, to cover the cost of the Standard Committee's work in preparing the Standard and the cost of illustrations and cuts for the Standard; and in case said breed or variety is not admitted, half of the fee shall be returned to the petitioners. A. F. Rolf moved that no breed or variety shall henceforth be admitted that is not represented by at least 50 active members of the A. P. A. and any breed or variety may be dropped from the Standard, upon the Standard Committee so recommending when it is represented by less than 50 active members within the ranks of the A. P. A. It appears that county fair associations in many places are growing tired of a long list of Standard breeds and varieties on which to split up their prize money, and they feel that the Association should prune out the dead wood, and thus enable them to centralize their prize money in encouraging and promoting purebred poultry as a practical proposition within their counties. Both the motion offered by Mr. Adams and that offered by Mr. Rolf were referred to the committee which is to be appointed by President Rigg on the revision of the constitution of the A. P. A.

Next Year's Meeting

The Board of Directors met at Knoxville and decided to hold the next annual meeting of the American Poultry Association at Philadelphia, Pennsylvania, second week of August, 1923. John S. Martin extended an invitation for this international association to meet in Toronto, August, 1924.

Petitions for recognition of Standard fowls of the following varieties were filed. The petitions were given their first reading at Knoxville, and will be acted on, according to the present constitution, at Philadelphia next year:

Rose Comb White Orpingtons; Old English Game in three varieties, Spankled, Black Red and Partridge; Buff Brahmas; Dominique Leghorns; Silver Laced Plymouth Rocks; Light Barred Plymouth Rocks, and Dark Barred Plymouth Rocks.

The Standard Revision Committee was dismissed, and upon motion of A. D. Smith, Illinois, was thanked for its untiring effort to give the breeders of the United States and Canada the best possible Standard. According to the constitution a Standing Standard Committee was appointed by the Board of Directors. This committee consists of three: E. C. Branch, chairman; A. C. Smith, and George Robertson of Canada. This was a splendid choice of men. Having spent many hours of many days working with them, we know their special qualifications for this work. This standing committee on Standards will make the report on the new breeds and varieties at Philadelphia next August.

Financial Report

U. R. Fishel, treasurer of A. P. A., reported for the year beginning July 1, 1921 and running to July 1, 1922, as follows:

Receipts	\$34,175.11
Paid out	28,135.82

Balance\$ 6,039.29

Mineralized Water Routs Chicken Lice

Tablets Dropped into Drinking Fountains
Banish Vermin, Make Fowls Grow
Faster and Increase Egg Yield

Any poultry raiser can easily rid his flock of lice and mites, make chickens grow faster and increase their egg yield by simply adding minerals to the fowls' drinking water. This does away with all bother, such as dusting, greasing, dipping and spraying. The necessary minerals can now be obtained in convenient tablets, known as Paratabs. Soon after the fowls drink the mineralized water,

all lice and mites leave them. The tablets also act as a tonic conditioner. The health of the fowls quickly improves, they grow faster and the egg yield frequently is doubled. Little chicks that drink freely of the water never will be bothered by mites or lice.

The method is especially recommended for raisers of purebred stock, as there is no risk of soiling the plumage. The tablets are warranted to impart no flavor or odor to the eggs and meat. This remarkable conditioner, egg tonic and lice remedy costs only a trifle and is sold under an absolute guarantee. The tablets are scientifically prepared, perfectly safe, and dissolve readily in water.

Any reader of this paper may try them without risk. The laboratories producing Paratabs are so confident of good results that to introduce them to every poultry raiser they offer two big \$1 packages for only \$1. Send no money, just your name and address—a card will do—to the Paratab Laboratories, Dept. 811, 1100 Coca Cola Bldg., Kansas City, Mo., and the two \$1 packages, enough for 100 gallons of water, will be mailed. Pay the postman \$1 and postage on delivery, and if you are not delighted with results in 10 days—if your chickens are not healthier, laying more eggs and entirely free from lice and mites—your money will be promptly refunded. Don't hesitate to accept this trial offer as you are fully protected by this guarantee.

Mr. Fishel stated that in addition there was \$1,456.51 which should be added to the balance, as his report was made up on July 1st, but he received some of the balances of the June business after the 1st of July.

U. R. Fishel was re-elected treasurer. O. L. McCord was re-elected election commissioner. Mrs. Thomas F. Rigg was re-elected secretary.

The Finance Committee submitted a budget to the convention, as follows:

Office of President	\$ 1,000
Office of Secretary	4,500
Office of Vice-Pres.	200
Office of Treasurer	200
Election Commissioner	
Directors	1,500
An edition of 25,000 copies of the new 1923 Standard	20,000
Miscellaneous	1,000

Total\$28,400

Barred Plymouth Rocks

Following the Chicago meeting of the Revision Committee, it was announced that the committee would recommend the inclusion in the Standard of a statement on the pullebred Barred Rock male and the cockerelbred female, same to be inserted in the preamble to the breed. Upon arriving in Knoxville, it was plain that the leading eastern breeders, including E. B. Thompson, Newton Cosh, and John W. Yant who is President of the Club, did not want these breeding birds Standardized even by way of description in the preamble, on the ground that it was folly to say that outward appearance, and not breeding and pedigree, was the true basis of merit in a breeding bird. The Revision Committee held, however, that it had pledged its word to include something of that kind in the preamble of the breed. Upon getting into this matter, Chairman Branch read an official communication from Leo T. Robinson, Secretary of the Barred Rock Club, in which Mr. Robinson said: "Our committee of the club voted solid that we wanted no compromise Standard adopted at Knoxville. It is our color description and Light and Dark names that our members ask for. And we'd rather have you shoot this whole thing all together even if it required a year's more time. We want the whole thing or nothing." Thus it was plain that the willingness of the Revision Committee to compromise this matter was unpopular and unsatisfactory in all directions. There appeared to be nothing to do but leave the Barred Rock Standard as it is in the 1915 edition. The matter did not come to the floor of the convention, as the Revision Committee gave up in its endeavors to find a workable solution of the matter, and the 1923 Standard for this variety will not be changed.

Publicity Committee

Grant M. Curtis told of the publicity work of the baby chick convention, and of their plans for raising a big fund to increase the sale of baby chicks through advertising and publicity. A. A. Yoder took the position that the A. P. A. should finance a publicity fund to increase the consumption of poultry and eggs for the reason that when market prices for these commodities are satisfactory the breeders of poultry flourish best. There was no mistaking the attitude of the convention on this delicate matter. When the roll call by states was taken at the opening session, there were 13 members from Indiana present, and 18 from Illinois, and these two delegations were solid for Standardbred poultry. Mr. Yoder's remarks were countered with the statement that the convention had been in session a day and a half, during which time a great deal had been said about utility and very little about what the American Poultry Association was organized for, namely, the Standardbred bird; and that if the A. P. A. wanted to do publicity work, it should do it along the line of promoting interest in more and better Standardbred poultry. It developed that the packers are already working on a great publicity campaign to stimulate the consumption of eggs, and the A. P. A. has pennies to their thousands of dollars.

The A. P. A. appointed a publicity committee with B. E. Adams, South Carolina, Chairman. Mr. Adams is telegraph editor of a daily paper. He has the ability and experience to do a wonderful piece of work in securing favorable publicity for the advanced Standards adopted at Knoxville. A. F. Rolf, in an editorial in Modern Farming, Louisiana, issue of August 25th, has set a model of intelligent comment on the work of the A. P. A. in establishing a Standard guide that will insure the highest efficiency from specimens which conform to the new Standards. Mr. Adams' committee can perform no greater service for Standardbred poultry than to similarly present the progressive work of the Knoxville conven-

Don't Crowd Your Pullets

In order to put the pullets in winter quarters in good condition, they should have plenty of air, room and feeding space. Oxygen is just as essential to egg production and growth as is the feed. A bird that has plenty of air and is fed on Ful-O-Pep feeds will be strong, well grown and fat—ready to lay nearly all through the winter. Birds that are crowded in the pens are likely to be weak—they don't get the full value out of their feed and hence do not make good production.

Don't try to make your pullets mature too early—birds that begin laying at four months are not likely to lay as big eggs or as many eggs as the birds that are allowed to get better growth. Follow the Ful-O-Pep way and

Have Them Shelling Out the Eggs at the Age of Six Months

You'll find it more profitable to keep your pullets from laying until they are about six months old—then if they have been raised the Ful-O-Pep way they will have the proper foundation and constitution to give you maximum egg production—you will get eggs—and get them during the season when egg prices are at their best.

If the pullets begin to mature and lay too early, on the Ful-O-Pep Growing Mash Ration, give them a little greater proportion of Ful-O-Pep scratch grains—plan their growth so they will mature at about six months of age. Much of your success next winter depends on the proper care and feeding of your young stock now. Keep the Ful-O-Pep Poultry Calendar where you can refer to it often—follow the instructions therein, both as to care and feeding and you will get results such as you never had before—you will understand then how "The Ful-O-Pep Way Makes Poultry Pay."

Take Advantage of our Free Poultry Service Department

This department is maintained to help YOU and every other poultry raiser—this service is free—USE IT. At the head of this department is Prof. O. B. Kent, formerly of the Poultry Division of Cornell University. His reputation as a poultry expert is far reaching—Ful-O-Pep patrons can share in the good fortune that enabled us to secure this man for this department. Write him about any of your poultry problems—he is not only willing but glad to give you any helpful advice.

The Quaker Oats Company

Poultry Department A. P. J.
Address Chicago, U. S. A.

FUL-O-PEP

GROWING MASH

Feed ALL Your Hens

"One Ful-O-Pep Dry Mash Self-feeder for Every Ten Hens." Repeat that sentence over several times until you are sure

you won't forget it—then see to it that you give plenty of hopper space to your hens. Just because a few of your hens lay well does not mean that *all* the hens have a good chance to lay. If the birds have to fight to get Ful-O-Pep Dry Mash they can't eat as much and therefore won't lay as well as if they have all the Ful-O-Pep Dry Mash they need *all* the time.

Feed *all* your hens *all* they want. By providing plenty of Ful-O-Pep Dry Mash self-feeders, the more timid hens will get the Mash as well as the more aggressive ones. The Ful-O-Pep Way calls for Ful-O-Pep Dry Mash before these laying hens all the time—that's the plan that gets results.

The FUL-O-PEP Way Is the Tried and Proved Way

If you are not feeding the Ful-O-Pep Way, begin now. Don't gamble with the hens—play safe. Why take chances on inferior feeds? Why not use the feeds that are tested and watched all through the manufacturing process and are known to be the best producing feeds on the market? High quality feeds mean low mortality as well as high egg production. Ful-O-Pep feeds that keep your hens laying all the time and keep birds in good condition are the feeds that pay. Feeds that don't do that are expensive at any price—you can't afford to feed such feeds even if you got them for nothing.

Ful-O-Pep feeds are the best investment the poultryman can make, because they pay big dividends. Ask any Ful-O-Pep user—ask any of the hundreds of the country's foremost poultry raisers—they will tell you that Ful-O-Pep feeds are unsurpassed.

Write for Free Ful-O-Pep Calendar

Send your name and address and we will send you a late copy of the Ful-O-Pep Calendar. This book has probably helped more poultry raisers succeed than any other poultry book ever published. You will find this book interesting and helpful—write for it.

The Quaker Oats Company

SURE QUICK DEATH FOR RATS and MICE

Remarkable Triple Strength Virus, Kills Every One—Not A Poison.

You can now easily and quickly kill all rats, mice and gophers with Triple Strength Virus—the most powerful concentrated virus known—the sure, safe way to destroy rodents. Positively not a poison. Harmless to humans, pets, poultry, stock, etc.—affects only rodents.

RATS DIE OUTSIDE

Rats flee because they become infected with a plague that affects the heart, blood vessels and lungs, destroying the blood corpuscles and causing suffocation. Rats rush outside to get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

SPECIAL INTRODUCTORY OFFER

To introduce this powerful Triple Strength Rat Virus, we will make every reader of this paper—for a short time only—a special offer of a regular \$2.50 bottle for only \$1 postpaid. This \$2.50 bottle Triple Strength Rat Virus is enough to clear a big poultry house, home, barn or yard of rats and mice. Send order today, sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question.

If not convenient to send money today—just send your name and address, a postal will do—pay postman on arrival. Remember, it costs you nothing if it does not do all we claim.

tion, along the lines of Standard making, to the farm journal editors of America, with a view to securing editorial comment on the gratifying advances made in revising the Standard along commonsense lines from a utility and breeding standpoint. The Standard was not revised merely for the benefit of a few hobbyists or fanciers, and the millions of poultry keepers should know that the new Standard was designed to help them and thus reflect to the credit of purebred poultry.

Judges' Section

The judges' section took cognizance of the editorial appearing in the March International Plymouth Rock Journal, in which it was charged that, "It cannot be denied that many of our leading wielders of the stick are allowing personal interests and connections to corrupt their better judgment to that extent that the rank and file of the exhibitors are becoming wise to the fact that there's something rotten in the state of Denmark. When judges of national reputation become so steeped in crime that they can no longer be trusted to render an unbiased decision, the exhibitor should have access to some sort of redress." In defense of poultry judging as an honorable profession, the judges' section passed a resolution, demanding that the editor of the above publication supply the names of the judges "steeped in crime," and cite "those specific instances, with adequate proof or evidence, when judges so charged violated either the written or unwritten rules of proper conduct in their work of adjudicating in American poultry shows." As Mr. Robinson editor of the publication in question, was not at Knoxville to defend himself, Walter Burton, Secretary of the Judges' Section, was instructed to mail him a copy of the resolution.

Mrs. Florence Forbes, President of the Judge's Section, called several meetings. The dinner at Whittle Springs Hotel was attended by 32 judges. J. Harry Wolsieffer of Philadelphia, was elected president of the Section for the coming year. The Judges Section recommended to the A. P. A. that because of the valuable services of Geo. Robertson of Canada, for which he had rendered only partial bills, that the usual fee of \$25 for a general judges license be waived and that Mr. Robertson be granted a license upon the recommendation of the Licensing committee. Same was unanimously approved by the convention.

Production Classes

The proposition of injecting production classes into the Standard and the poultry shows did not come before the convention. Grant M. Curtis, chairman of the Committee of Forty, which made the recommendations on production classes to the Seattle convention last year, stated to this writer that he did not favor them, because their adoption in the Standard and shows would be a confession that there was something lacking in the Standard exhibition bird, which has been the basis for all progress made from the barn-yard mongrel up to the present time. The idea of two sets of birds, two sets of prizes, and a double standard for judging in our show rooms seems to have died before reaching Knoxville.

True to its traditions of half a century, the Revision Committee faithfully sought to make the Standard exhibition bird of 1923 the last word in symmetry of form and usefulness. Those backs which carry their width from the hips to stern, and those deep bodies which provide room for large intestinal development, are made a part of the new Standard text. Judges are instructed, in the new Standard text as adopted at Knoxville, to handle the birds for back and body shape, and not merely judge them on the basis of plumage contour, or profile shape. We have been slack on this in the past. On checking up, it was found that the Leghorn, Ancona and Red Cap breeds had no width of back as a part of their Standard shape descriptions. In other words the 1915 Standard simply described the kind of a profile Leghorn and Ancona that you could draw on a piece of white paper and hang up on the wall. Judges henceforth, however, will have to get down deeper and not deal merely with the external, which we must concede is partly superficial. Frank F. Conway, Illinois, brought this point forcibly to the Revision Committee. He cited two Buff Orpington hens in his yards, one whose back pinched in from the hips to the stern like a flat iron, and another whose back carried straighter sides from the hips back. Both were broad cushioned hens, and good show hens under the present Standard, yet one was a poor layer and the other was a good layer, because of the difference in the formation of the carcass. Mr. Conway made his points all the clearer by bringing into the Revision Committee's meeting at Knoxville several hens which he had secured from local

breeders. The demonstration resulted in a sub-committee being appointed to draft new instructions to judges on the judging of body shape as well as outward or typical shape. The matter is of such far reaching importance that the editorial in this issue headed, "Internal Capacity," deals in detail with this subject and the action taken on this subject at Knoxville.

Egg Standard

The Revision Committee drafted an egg standard for inclusion in the 1923 edition, in accordance with the instructions of the Seattle convention. This standard calls for two classes of eggs, brown and white. Minimum weight, 24 oz. to the dozen. Maximum weight, 28 oz. to the dozen, since this is the largest egg that can be shipped in a standard egg case filler. Pullet eggs form another group, and their minimum weight is to be 20 oz. per dozen.

Judging Licenses

The committee on judges licenses reported that 19 candidates had been examined for licenses. Of this number, 14 applied for a general license, and five for a special license. The committee recommended that one general license be granted and that four specialty licenses be granted.

Standard Changes

The Revision Committee's report went through the convention with few changes of major importance. The work of the committee stands practically as reported after the Chicago meeting of last March, with such changes of importance as are here-in-under recited.

Debate followed the Committee's recommendation that the lobes of Wyandottes and Rhode Island Reds be solid red with any enamel white to disqualify. Several seasoned breeders objected to this recommendation on the ground that a grand, good bird should not be thrown completely out because of a small technical defect.

The Revision Committee stated that when the 1915 revision was made, breeders of White Wyandottes promised that if they were allowed one-quarter white in ear lobes at that time, they would accept positive enamel white as a disqualification in 1923. The committee maintained that if the standard was not going to be advanced, so as to put a premium on progressive, constructive breeding, there was no need to revise it, and the 1915 edition would answer the purpose. The convention concurred in the recommendation, and voted to advance all breeds in the American class to the level of the Plymouth Rock breed, in which any enamel white disqualifies. The same lobe disqualification will apply to Orpingtons.

Wyandotte type was changed to moderate length in back, body, lower thighs and shanks. Chas. Nixon, New Jersey, proposed this change, and the argument was advanced that the shortness of the Wyandotte was more apparent than real, due to plumage contour, and if a true Wyandotte and Rock were killed and dressed, there would be no difference in the length of carcass. The fad ten years ago for short Wyandottes, a bird of steep curves, injured the breed, and the return today is to what Frank Davey would term "a sensible chicken."

Partridge Color

T. W. Schoen, Mississippi, appeared before the Revision Committee, and asked that the neck of the Partridge female be not required to have distinct, well defined penciling, but that the 1915 standard requirement of slight penciling be approved. Mr. Schoen stated that Partridge breeders wanted a single mating standard and that it would be impossible to produce on extreme penciled hackle on the hen and hold the solid black sections of the male. The Committee conceded the merit of his contention, recognizing that the Partridge Standard was calling for all the color of the Brown Leghorn male, yet the Partridge female expected to produce that male was a long call from the Dark Brown Leghorn female, with her solid black stripe in neck and metallic colored back.

A. O. Schilling supplemented Mr. Schoen's request for a Standard based on sound breeding practice, by exhibiting some feathers secured the day before in the yards of H. B. Hark near Cincinnati. He stated that the slight red shaft was characteristic of Sheffield Farm's well-known-to-be single mated line. It is also known that a slight red quill is not uncommon in the best of the famous Mitchell Partridge Cochins which have been single mated for many years, with results equaled by no other breeder in the world.

Mr. Schoen exhibited a cockerel and pullet to the Revision Committee that were brother

There Is No Substitute FOR BASIC FEEDS FOR POULTRY

As proof of this claim we refer you to the thousands of the most successful poultry raisers in the country—those who have proven by experience that the use of Basic Feeds best insure

- High fertility and great hatchability during the breeding and incubating season.
- Low mortality among chicks—wonderful growth and development with our starting and growing feeds.
- Low cost of egg production throughout the year.
- Healthy, vigorous stock—always in good condition.

The reason for the remarkable records Basic Feeds have made throughout the poultry world is due to their quality. They are 100% quality feeds—made from choicest grains and feeding stuffs that the world produces and according to formulas that have proven best.

Write for Free Samples and Descriptive Literature

Send us your name and address and we will send you free samples of Basic Feeds so you can compare them with other feeds. We want you to see the big difference between ordinary feeds and Basic Feeds—the samples will show it. Try Basic Feeds on your flock and your birds will prove it. If your dealer can't supply you we will ship you any quantity direct from our mills.

The Basic Feeds Company
Dept. 325 LOCKPORT, ILL.

1000 EGGS In EVERY HEN

If You Keep Chickens CUT THIS OUT

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through

cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how. If you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860 P, Herald Bldg., Binghamton, N. Y., and a free copy of "The 1,000 EGG HEN" will be sent by return mail.

Everlay Leghorns

The Famous EVERLAY Strain of Brown Leghorns hold a World's Record made at the American Egg Contest. Hundreds of enthusiastic customers have found them just what they so much desire, great layers, less feed, so hardy, active and clean on city lot or farm. They have won at all the big shows and will win for you. Just write your needs. Catalog upon request. Bargains in cockerels for show or flock.

Science Discovers Greatest Lice Killer

Changes Old Methods—No Dusting or Spraying—Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 303, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

and sister. Based on the evidence, the committee recommended that the Partridge female have a striped neck slightly penciled as in the present standard and that occasional or slight red shafts or quills be allowed in the back and saddle of the Partridge male. The convention adopted these recommendations, and the Partridge breeders thus receive the most common sense and scientific Standard ever written for Partridge color. It makes of the Standard male and female, mates that are true and consistent with one another, and this was the biggest advance made in the writing of color Standards for the 1923 Standard of Perfection.

Leghorn Weights

The question of Leghorn weights came up in an afternoon session. The Revision Committee, sitting at Knoxville, had voted to make no recommendation to increase the weights of cock or cockerel, as a 5½ lb. cock and 4½ lb. cockerel seemed to be all the average breeder could stand or perhaps needed in this highly specialized egg breed. The committee did recommend that the weight of hen be increased to 4½ lb. and of pullet to 4 lbs., with more than 1 lb. underweight to disqualify. What your Revision Committee was driving at was to give the ax to hens of less than 3½ lbs. and pullets less than 3 lbs. Everyone in the convention agreed that the pee-wee Leghorn was doomed, that the 2½ lb. Leghorn pullet was a slander on Standard exhibition poultry. How to kill off the little Leghorn and not make an elephantine breed of the Leghorn was the question. A. F. Rolf, representing the affiliated Leghorn clubs of four thousand Leghorn breeders, opposed an increase in weights, but added that if the convention felt that it must increase the female weights, consistency required that they increase the males also. The Revision Committee's position was negative rather than positive. It did not want to force a cockerel heavier than 4½ lbs. unless the breeders were pretty well agreed that they wanted it; but the committee was a unit in wanting to meet the criticism of "spindle-legged Standard Leghorns," and insisted that a pullet of less than 3 lbs., being unfit for the laying house, should not be allowed to win a prize in this great economic breed under the rules of the Standard. The issue was deadlocked when the convention adjourned for the day. The next morning the batteries again opened up. Wm. Blackman, California, made a strong plea for more weight. Harry Collier, representing the Leghorn men of Oregon, Grant M. Curtis, representing Leghorn men of Washington, and Geo. England of California, contended that the Pacific Coast birds were not as big as some imagined and the present female weights were all the breeders could stand. A compromise motion was then made, calling for the present Standard weights, with a disqualifying weight of 1 lb. on cock and cockerel, and a disqualifying weight of ½ lb. on hen and pullet. This motion was seconded by Mr. Rolf, and harmony reigned supreme. The Standard weights for Leghorns now are: Cock, 5½ lb.; cockerel, 4½ lbs.; hen, 4½ lbs., and pullet, 3½ lbs. The disqualifying weights are any fraction of a pound below 4½ lbs. for cock, 3½ lbs. for cockerel, 3½ lbs. for hen, 3 lbs. for pullet. It was agreed that these disqualifying weights would protect the breed from the miserable little, fine-boned specimens that have been getting by in some show rooms, and remove the stigma of the Standard Leghorn being a little, weak specimen.

Buff Minorca weights were made the same as those of the Black variety.

Blue Andalusian lacing was described as sharp. The club had asked that this variety be given high shoulders with a back and body that tapered in toward tail. Upon the adoption of the chapter on body shape which is to be determined by handling, Horace Murphy, Indiana, prominent in Blue Andalusian affairs, asked that the shape descriptions of male and female be amended to give the variety straighter sides from shoulders to stern, so that this Mediterranean fowl might not have its egg power reduced. The Revision Committee complied with this request and the convention approved.

Blue Orpingtons and Blue Rocks were given the same color description as the Blue Andalusian. It was conceded that the Blue Orpington would meet the requirement with great difficulty because of black tops on the males inherited directly from the Black Orpington.

Quality of Feather

White and buff varieties are required to have a smooth nicely webbed out feather to meet the new ideals established by the convention at Knoxville. Plymouth Rocks and Rhode Island Reds are to have a moderately broad feather in back to get away from long, stringy, narrow feathered birds. Wings and tails throughout the Standard, with few ex-

ceptions, are to call for rather broad, overlapping feathers. Twisted wings are made an absolute disqualification. Slipped wings, not due to missing or immature feathers, disqualify. The new Standard will not deal merely with color and profile shape. There must be the right kind of plumage and carcass shape. Those utility men who have been hammering the Standard exhibition bird now have an opportunity to prove their ability as breeders. We wager a big red apple that the fancier-breeder will beat them to it in the future, as in the past.

Buttercups

R. J. LaLone, secretary of the Buttercup Club, asked that the variety be given white lobes and suggested that Buttercups be placed in the Mediterranean class. The convention voted white lobes, with more than three-quarters red to disqualify, and listed the breed as a member of the Continental class.

Anconas

Ancona breeders accepted the white lobes, instead of white or creamy white as in the present Standard. H. C. Sheppard, and Frank C. Stier of the United Ancona Club were present. The increased mottling from one to five to one feather in two ending in a neat, clear white tip, was approved by them and the convention. Both Messrs. Sheppard and Stier objected to going farther at this time and making a specific requirement for yellow shanks, instead of "yellow or yellow mottled with black," which the present Standard allows. There was a division of opinion on this point. Some members of the Revision Committee insisted on establishing one color for shanks and cutting out the double description. All through the work of revision, double descriptions had been stricken out, for, they maintained, the A. P. A. should make an ideal Standard, not a selling Standard. Other members of the Revision Committee took the position that the Ancona men should not be given a heavier load than they could bear, that there had been wonderful advancement in the breed in the last ten years and it should not now be killed by idealists, that the Ancona breeders had accepted white lobes instead of "white or creamy white, that they had accepted 250 per cent more white tipping than the 1915 Standard calls for, yet had to maintain the same black tails and sound wing flights, and they, therefore, should not be asked to take four steps when their legs were only long enough for three, lest they fall and go into collapse. The convention concurred in this opinion and shanks were left "yellow or yellow mottled with black."

Orpingtons

Artist Schilling submitted the Buff and White Orpington pictures, which received the hearty approval of the convention. Speakers at the convention expressed themselves as proud of Arthur Schilling, a gifted artist, a student of breeds and breeding, who is devoting the best years of his life to purebred poultry. The Orpington Standard as submitted by the Revision Committee met the unanimous approval of the convention. A forward dip to breast was not included in the committee's recommendations. Orpington men present included J. S. Greenshields, Harold Rawnley, M. F. Delano, C. S. Byers and Frank F. Conway.

Speaking for this delegation of Orpington celebrities, Mr. Greenshields highly praised the Revision Committee, stating that the committee had given the breeders the best Standard ever written, and that the committee had shown sound judgment in saving the Orpington from those of its friends who wanted to put the crouching Cochins into it.

Mr. Conway asked that the comb of the Orpington male be changed from "rather large" to medium in size, so as to correspond with the female comb. The convention approved this change, as the Revision Committee had prepared new "Instructions to Judges" for the new Standard on the explanation of terms, in which it is explained, for instance, that a medium sized comb on a Plymouth Rock and a medium sized comb on an Orpington does not mean that the Orpington should carry a Plymouth Rock comb, but does mean that the Orpington male should have a comb of medium size in proportion to the size and bulk of the breed.

Odd Varieties

Artist Schilling presented the convention with his compliments, idealized illustrations for the new Standard of a pair of Mille Fleur Bantams, Silkies and Frizzles. Some opposition arose over the acceptance and inclusion of the pictures of Frizzles, and a motion was made to not accept them and drop the Frizzles from the Standard. When put to a vote the motion was overwhelmingly defeated.

On Sept. 1st we close our ninth year of Bred to Lay and Pay strain of S. C. White Leghorns. Our aim has been to produce a strain of Egg Layers superior to all others. This we believe we have accomplished. We have thousands of satisfied customers, many of whom have furnished us with testimonials stating the marvelous egg records made by our strain in their hands. Some of these testimonials we have published and some are printed in our catalogue. In all we give the date, name and address of the writer, so that you can easily substantiate the authenticity. To furnish further proof of the Egg Laying ability of our strain since 1915, we have yearly entered our birds in official Egg Laying Contests in many different parts of the U. S. No other breeder of any one breed has ever approached our records. True some have won one or two contests, in dozens of starts, up one year and down the next, but ours have been a steady, consistent winning record in all parts of the United States from ocean to ocean, thus showing the high average Egg Laying ability of our strain under many different managements and climatic conditions. High Flock Egg averages should be the goal of all poultrymen. Upon their average egg yield depends the amount of profit. The greater the flock yield, the greater the profit.

Our contest winnings up to November 1st, 1921, have been published many times

and we will gladly furnish these records for the asking.

Four of the first five winning pens at the Second Western Washington Egg Laying Contest were Pure Hollywood strain. One by our own entry and three by customers. These twenty pullets laid 5,300 eggs, an average of 265 eggs per pullet. A nice average we think. For two consecutive years we have had winning Leghorn Pen and best individual at Storrs, Conn., Contest. This year we are again leading with practically no chance of being headed. This will make three consecutive years win, and we had best Leghorn pen in 1917-1918 Contest. Four wins in last five years. A record to be proud of.

We have eighty-three acres devoted exclusively to Leghorns and we believe we have the largest trap nested breeding establishment in the world. We have 5,200 pullets that will finish their 365 days' records shortly. From these we can supply you choice breeding hens with known egg laying records. We have on range the finest lot of cockerels ever reared by us. All of them from dams with known trap nest records and sired by males from parentage of known records. We solicit your patronage, and if favored with it, will surely satisfy you.

We are as anxious as our customers can possibly be, that our strain makes good in their hands. We know that upon the success of our customers rests our success.

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly
Kills Them All—Not a Poison

Rats, Mice, Gophers—in fact all Rodents
can now be wiped out easily and quickly. Im-
perial Virus will do it. This new discovery
is a fluid, true Virus. Entirely harmless to
humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on
bait. Sets up burning fever. The pests com-
municate it to others, and all die outside, hunt-
ing air and water. Imperial Virus is put up
in sealed bottles, thus insuring full strength
and potency. Only safe, sanitary method to
overcome these pests. Protect your Poultry,
especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency,
M. O., Checks, etc.) and we will give you
by return mail, postpaid, two regular, full sized
(double strength) \$1.00 bottles of Imperial
Virus. Use one to rid your place of these
pests, and sell the other to a neighbor, thus
getting yours free. Special inducements to
represent us.

If more convenient, send no money, just
your name and address to Imperial Labora-
tories, Dept. 1040, 2110 Grand Ave., Kansas
City, Mo. Pay postman \$1.00 and few cents
postage when two bottles arrive. Guaranteed
to do the work to your entire satisfaction
within 30 days or your \$1.00 will be cheer-
fully refunded.—Advertisement.

Now's The Time
to have us plan poultry advertising that pulls
more Fall business and profits. Booklets,
catalogs, "catchy" letter head, trade mark,

Catalog. C. M. LAVER, Box 21, McAllisterville, Pa

The Committee on Protection and Promo-
tion of the Poultry Industry was continued
with Prof. Jas. E. Rice as chairman. An
invitation was extended through Professor
Rice to the international officers of the
World's Poultry Congress to hold the an-
nual meeting in the United States in 1924.

President Thos. F. Rigg was authorized to
appoint a committee of five to revise the con-
stitution and laws of the A. P. A., said com-
mittee to render its report at the Philadelphia
meeting next year. President Rigg stated
that he would give the matter of selecting
men for this committee serious consideration
and would announce the personnel of the com-
mittee through the poultry press at as early
a date as possible. By agreement, pending
constitutional amendments were not pressed for
action at Knoxville and will be referred to
the committee to be appointed on constitu-
tional revision.

Mr. Blackman, California, recommended that
the A. P. A. take a more active interest in
egg competitions, and a committee was ap-
pointed, with him as chairman, to formulate
rules that would be applicable to contests in
which Standard bred poultry is tested. A. D.
Smith and C. P. Scott, Illinois, who have
been demonstrating the value of good Stan-
dard poultry at the Illinois contest, Quincy,
expressed the opinion that Mr. Blackman had
hit upon an important matter and his com-
mittee could be of great service to the in-
dustry.

Professor Martin of the Kentucky Agricul-
tural College reported that the introduction
of Standardbred poultry into certain coun-
ties of that state had resulted in an average
increase of 1 lb. per bird, and that the eggs
had so improved that they now go on the
eastern markets as "western" rather than
"southern."

Poultry Show Managers

A Poultry Show Managers Section was or-
ganized with D. E. Hale, Illinois, as Presi-
dent. Rules will be drawn up and presented
for adoption to the A. P. A. at the next an-
nual convention. A number of shows, espe-
cially large shows, openly ignore, even treat
contemptuously, the present A. P. A. show
rules.

With a new Standard that seems to be a
long step in advance, with a judges' licens-
ing committee that is putting candidates through
an examination that can be criticised only be-
cause it is severe, and with some of the show
managers pledging anew their loyalty to the
only national organization the purebred breed-
ers have, it begins to look like the dawn of
a new day when a community of interests
will be harmoniously affiliated for the com-
mon good of all.

Men of Achievement

Reese V. Hicks, Missouri, was there, the
same Hicks as was president of the A. P. A.
ten years previous when the convention was
held in Nashville, Tenn., August, 1912. Only
now, Hicks is a grandpa. Doesn't seem pos-
sible. Yes, we all get older a day at a time.

John Marvin, Wisconsin, made a noteworthy
report. This faithful friend of the old asso-
ciation reported 109 new members for the
A. P. A., secured in Wisconsin during the
past year, and of this total Mr. Marvin
personally had secured 98. Such work should
not go unnoticed. It is the practical side of
the thing which is necessary to make the mare
go.

P. D. dePool of Cuba, who attended the
meeting in Kansas City two years ago and
later visited a number of poultry plants in
United States, was in attendance at the Knox-
ville meeting as the representative of General
Pedro Betancourt, Secretary of Agriculture,
Cuba. Mr. de Pool plans to stage a big poul-
try exhibition in Havana, to which leading
American breeders will be invited to consign
birds.

W. P. Hofferbert was in the hotel down-
town meeting arriving delegates when the pic-
ture of the Knoxville Entertainment Commit-
tee was taken in the park. His picture un-
fortunately, could not appear in the group,
but he too rendered conspicuous service in
making every visitor comfortable and happy.
Other members of the Entertainment Com-
mittee were Mrs. R. R. Stripling and Mrs.
F. H. McCrae, Jr.

Rigg to Stand for Re-election

At the close of the convention, Mr. Rigg
announced that he had a man's job, involving
many thousands of dollars and great respon-
sibility, in getting out the new Standard of
Perfection. He said that he wouldn't have
much time to spend in attending to politics,
but that he desired to state now, so that his
friends would understand, that he will be a
candidate for re-election as president of the
association at the next election.

Final Comment

In summing up the work of the A. P. A.
convention, and pointing a moral, the Knox-
ville Sentinel published the following leading
editorial after the close of the sessions. R. E.
Gettys, Knoxville, kindly mailed it to us:

"Working Toward Ideals in Efforts for Success"

"Perhaps the most important work done
during the session of the American Poultry
Association, entertained in Knoxville last week,
was that in regard to the Revision of the
Standard. Men representing fortunes watched
eagerly for suggested changes of Standards,
even in the most minute detail. An observer
could see, however, that the chief concern
was to improve the poultry industry of the
country, and not to advance the interest of
breeders of any one kind of fowls.

"It has ever been characteristic of great
and successful men and enterprises to care
for detail. 'Save the pennies, and the dollars
will take care of themselves,' is taught the
world over. A zealous careful guarding of
the minute details of business affairs spells
success.

"A glimpse at the personnel of the Revi-
sion Committee that presented to the poultry
association the report on Standards reveals
that it represented large interests. Men of
national reputation, men of years of experi-
ence, men trained in the industry, experts
on investigation and artists of high grade.
These men sat hour after hour and day after
day deciding just exactly minute questions.
The question of just how much, if any, white
might appear on the ear lobe of a certain
breed illustrates detail that shows how min-
utely the matters were considered.

"The goal held high before the poultry
breeders of the world is 'perfection.' Every
move made was thought by those in the con-
vention to be towards that goal, and breeders
of any kind of chicken know that to be ad-
mitted to the organization, and to have recog-
nition among the poultry breeders of the
world, this goal must be approximated.

"The satisfying thing about the work of
the poultry association is that the standards
adopted will be strictly adhered to by all
members of the association. The Revision
Committee will not offer further changes for
eight years.

"The world today is divided on many great
moral questions. Standards of right and wrong
are not adopted in detail. Might not the
moral world, the social world, the religious
world profit by just such procedure as here
illustrated by a business industry?

"More conformity to ideals and standards
in the educational world would without doubt
be beneficial to both pupils of the schools
and to educators.

"Certainly, when scores of prominent men
representing a large and growing industry
came into our midst and gave a demonstra-
tion of fidelity to detail in the promotion of
their business, it brings a lesson to many lines
of activity that is worthy of notice."

Tonic for Hens During Molt

A well-known tonic—Douglas Mixture—is
with good results added to the drinking water.
It has stood the test for years. It is cheap
and easily administered. The mixture consists
of sulphuric acid, half an ounce; sulphate of
iron, a quarter of a pound; and water that
has been boiled, one gallon. These are the
constituents and proportions, and the quantity
mentioned will suffice for a hundred fowls for
a year. A teaspoonful of the mixture added
to each half-pint of drinking water is suffi-
cient. The drinking dishes in which it is sup-
plied to the fowls should not be of iron. As
sulphuric acid is a poison, it will be safe to
get the mixture prepared by a chemist. When
prepared it should be kept in large corked
bottles and labelled "Poison."

Where Douglas Mixture cannot be conven-
iently provided, the purpose will be served by
putting a few crystals of sulphate of iron into
their drinking water, and failing both these
tonics, recourse may be had to the old time,
trusty nails which mothers and grandmothers
were wont to put into the drinking water
of their fowls.—Poultry News, Scotland.

Illinois Egg Contest

Illinois egg laying test, supported by state
funds, is conducted in the interests of Stan-
dardbred poultry. C. P. Scott and A. D.
Smith, directors, are boosters for the purebred
poultry industry. They are demonstrating on
the testing grounds at Quincy, Ill., the value
of the Standardbred hen. The next annual
contest opens Nov. 1st. Entries close Oct.
15th. Only Standardbred birds are eligible.

caster, Mo.**

Individual Records Without Trapnesting.

By C. E. Ashbrook

As Backlotter guided his interested
guest about the busy back yard "egg fac-
tory," he explained how he managed to
keep so many fowls on the small piece of
ground. He described in detail his meth-
ods of selecting and breeding the layers
for his Standardbred-to-lay flocks.

"Of course the housing, feeding and
special methods of inducing the fowls to
exercise are all important," explained
Backlotter, "but without selective breed-
ing a fellow would never improve his
flock."

"The Barred Rock with the
'Engagement Ring'."

"Y'see that group of hens; all but one
of 'em laid heavily as pullets from Sep-
tember to November of the following
year and commenced again in January.
They were never sick a day. That's the
kind of hens we put in our breeding
pens."

"See that Barred Rock? She wears
an 'engagement ring' though her fiance
will not be selected till this fall."

"You got to know your prospective
breeders from the time they pop from
the shells."

"Ahem, Nephew," insinuated Uncle
Jimmie, "they's about five hundred chick-
ens hereabouts. You got a right smart
memory for fowl faces to pint 'em out
and give their hull hist'ry."

"P'intin' 'em out an' tellin' their
hull hist'ry."

"Oh, the chickens are identified by the
leg bands," replied Backlotter. "Every
fowl carries a brief, but adequate record
of its performance right on its leg. Now
the way we leg band 'em"—

The leg banding begins with the young
cockerels. The young 4-weeks-old An-
cona cockerel showing a well developed
and reddening comb, and possessing size
and "snap" gets a baby chick band.

Such a cockerel may not in the final
selection qualify for the breeding pen
but early development and vigor will be
several points in his favor.

The pullets are leg banded as they be-
gin to lay.

The March hatched pullets starting to
lay in August get two blue rings.

From 25 per cent to 40 per cent of
these pullets will molt in the fall. Those
that molt have one band removed and
placed on the other leg.

The molting pullets will go in the
breeding pen in the spring and in the
writer's opinion they are superior as
breeders to the older hens that have
served a year or more of time in the
laying house.

The later hatched pullets laying before

the sixth month get a red band. Those
laying at seven months get a blue band.
Any pullets failing to lay at seven
months receive no band at all.

Anconas will lay at four months but
will not attain proper weight and vigor
if allowed to lay at this age.

No further leg banding is done until
the following year at molting time.

The red banded hens that molt latest
are prospective breeders, if at the breed-
ing season they are again early layers,
are in good condition and if proper
weight and good feather, they get the
white "engagement ring."

The red banded hens molting earlier—
in September and early October, will be
second choice as breeders. The blue
banded ones molting late will be third
choice.

Fowls without bands are all "suspects."
This class is made up of fair layers,
near-loafers and out and out slackers.

The unprofitable ones are sold. They
are easily located as we seldom find a
banded pullet going to roost with lightly
filled crop and getting up late in the
morning. The exception is when the
banded pullet is out of condition.

The remaining "bare legged" stock and
all early molters are marketed in the
fall. The engagement ring hens of good
weight and feather will serve as breeders
excepting any that may fail to get an
early laying start. In that case second
or third choice hens of better promise
are substituted. The selected cockerels
are already in the breeding pens.

Any fowl that has been sick gets a
black leg band which disqualifies her as
a breeder. We are often asked how we
"spot" the pullets as they begin to lay.
The Ancona bleaches her earlobe with
the first few eggs that she lays. Of
course the condition of the comb and the

changes taking place in the abdominal
region tell the story too; but the bleach-
ing earlobe is the most prominent sign.
Sometimes a pullet will lay a few eggs
and then rest before she hits her laying
stride. She loses her band as she loses
our confidence. Sometime an early lay-
er and late molter may not be a heavy

Young Anconas with a quick-sprouting comb.

layer, indicated by the extent to which
the shanks are bleached out before molt-
ing time.

With a system of leg banding it is
easy to select at sight the early heavy
and long laying hen, also the late starting
and soon-quitting hen that should be
marketed in the fall of her pullet year.

For those who have no time for trap-
nesting, the colored leg bands express an-
other and easier method of increasing
the efficiency of the flock.

"When the Cat's Away."

One of the problems agitating the mind of the poultryman is how to rid the premises of rats.

The rat is much more intelligent than his foolish little cousin, the mouse, who will obligingly walk into simple little traps.

The rat ignores the traps, will eat quantities of poisonous bait, continue to chew holes in the poultryman's profits, and often will carry in disease.

Rat poisons and exterminators are effective where the poultry plant is somewhat isolated.

In town where rats colonize on adjoining premises it is next to impossible to exterminate them unless the neighbors can be persuaded to organize a rat squad and make general war on all the pests.

One of our poultry houses had a dirt floor, in and through which the rats burrowed, homesteaded and fattened on our feed in spite of all our best and various rat catching efforts.

One day we asked our neighbor for his best rat exterminating formula.

"Christmas," our neighbor enigmatically informed us.

"Christmas? Where do you get 'em?" we asked.

"You don't get 'em," said Bill. "Christmas" is our cat, you know. We

wouldn't part with him. There isn't a rat on the place, 'Christmas' attends to that."

The neighbor's rat squelcher being out of our reach we decided to try out our own cat.

"Toots" was a young house cat with two ambitions: to hold down the most comfortable chair and to get down all of the family milk supply. With little faith in "Toots" prowess as a ratter he was locked in the poultry house at evening time. The hens were only slightly nervous and suspicious of him and after the first night he was on familiar terms with them.

He was accepted as one of them and was permitted to rub his back against them as is the way of a cat in expressing love or esteem or whatever it is that the cat does wish to express. He never frightened them as would a barking dog. It was not long before Toots' belt line began to shrink. Rat killing and eating has no tonic effect on the cat. She thinned out and so did the rats. When Toots came through a spirited engagement with wounds he was kept in the house and fed milk and catnip for a day or two after which he was glad to return to his job.

The moral to this trivial story is this: "Toots" is just a cat with no particular gifts or talents—any cat is a natural enemy and hustler of rats and if shut in the poultry house at night will respond to his instinct when the rat emerges from his burrow.

HALL

Beats Mother Hen

Twenty per cent improvement over ordinary hatches means profit in more ways than one.

The method of incubation which produces the greatest number of chicks produces the strongest chicks.

The increased profits are twofold—number of chicks and their vitality.

For a generation the Hall Mammoth Incubator has been noted for the large number and high quality chicks it produces. This result was obtained by the maintenance of the proper incubating temperature and correct moisture and ventilating conditions.

Now comes the Hall Mechanical Egg Turner Tray which holds the eggs in correct hatching position—large ends up. This position enables the air cells to form where the chick's head should form, in the big end—which turns every egg, every time and which prevents the eggs from lying flat or worse still lying with the big ends down.

There's only one Mechanical egg turner in the world that accomplishes all this—and that is the Hall. It has no rival.

The Hall Mammoth Incubator Co.

Originators of Coal-Heated Incubators and Coal-Heated Colony Brooders

180 Southern Avenue, Little Falls, New York

Read what our customers write regarding improved results:—

More Chicks—No Broken Eggs

Rohrerstown, Pa., June 10, 1922.

We have found the Hall Mechanical Egg Turner most efficient and in addition to being a wonderful labor-saving device, the increase in the number of chicks hatched from eggs turned in this manner netted just 10½% more from all eggs set in three tests over the old method.

The tests were thorough, for the eggs used were taken from the same flock of hens, the ages of the eggs used alike under the different methods of incubation. In the first test a sitting hen was used along with the turning device and the old hand turning way, and the eggs mechanically turned yielded 2¼% more chicks than those under the hen, and 15% more than from those hand turned. This meaning percentage of all eggs set. The breakage under all three methods was none. We must add, however, that all season not an egg was broken by the Mechanical turner.

We certainly congratulate you on this excellent and most efficient appliance.

SPRECHER BROS., Twin Pines Farm.

Wonderful Improvement Over Old Style

Suffield, Conn., April 10, 1922.

I will gladly say that the Hall Mechanical Turning Trays we received from you are certainly a wonderful improvement over the old style of trays.

I can turn all my eggs in eight minutes much better and more satisfactory than by the old method.

I used to turn twice a day and now turn every five hours.

I ran a test hatch, part of eggs in old trays and part in the new and got over eighteen percent better hatch from the new trays.

I fill the metal trays during the last three days of hatching and thus have the eggs all ready to put right back and then have eighteen days to wash and dry the old trays.

H. W. LAMBERT, Hilltop Farm.

Bee Keeping for Poultrymen.

By E. W. Atkins.

There are no two branches of farming that can be worked together to better advantage than bees and poultry. Bees may be kept with profit in practically every section of the United States where one can be conveniently located to good markets for poultry and eggs.

"Don't put all of your eggs in one basket" is an expression frequently heard these days. A combination of the right kind of baskets may sometimes prevent all the eggs from being smashed. One who desires to take up more than one highly specialized branch of agriculture, must carefully consider how the management of one line fits in with the management of the other, whether or not a big increase in capital invested in land and building is necessary, and whether the location and soil are adapted for both lines, etc.

The site for an apiary should be on well drained soil, which is also ideal for poultry. Seventy-five to one hundred colonies (hives) of bees may be nicely accommodated on a good sized lot, and if desired, poultry may be allowed to forage among the hives without any danger to either the bees or poultry. The bees obtain their source of honey in the surrounding territory up to the distance of a radius of at least two miles from the apiary.

During the busy hatching season, but little attention is required by the bees. Throughout the summer, bees may be worked to the best advantage during the warmest part

each colony during the winter, the successful beekeeper leaves at least twenty-five pounds of honey and then at least twenty pounds for each colony are stored in honey combs in what is termed an extra hive body, which is given to the bees in the spring.

An extra hive body is merely an extension to the section of the hive which the bees are wintered in. By providing the extra hive body in the spring, not only is an additional food supply furnished for each colony, but the queen bee is provided with adequate room for egg laying. During the height of the season a vigorous queen bee is capable of laying from two to three thousand eggs daily. A hen laying that many eggs would fill from four to six bushel baskets full. Some wit has said: "The problem is to make a cross between the queen bee and the hen."

During the honey flow, the major problems are to keep the colonies from swarming. The impulse to swarm may arise early in the spring. To give a colony of bees plenty of room for breeding previous to the commencement of the honey flow very much reduces swarming. An abundance of room must be provided for the storage of honey during the honey flow, together with good ventilation and a well insulated cover.

With good management in an average season in many parts of the United States, an average of seventy-five to one hundred pounds of extracted honey per colony may be obtained. This production makes beekeeping at least a sideline well worth considering in conjunction with poultry.

Taking the second crop of honey and preparing the bees for winter. A September scene.

of the day, at times when the poultry work is finished up in the morning and before it is again started in the afternoon. Bees do not require regular attention, and their requirements may very conveniently be furnished in advance of their needs. In many localities, especially in the North, bees may be fixed up in the fall so that they need practically no attention until the time the fruit trees come into bloom the following season. This allows practically full time to devote to the poultry during the winter, with the possible exception of some time required for the preparation of some beekeeping equipment. This may be prepared during slack periods any time in the winter.

Successful beekeeping calls for a study of bee behavior and the honey plants in a locality. Beekeeping management may be divided into two periods. One period pertains to the rearing of an enormous force of worker bees, which must be on hand at the time the plants which yield nectar in sufficient quantities for the bees to gather surplus honey from, come into bloom. During the second period, the beekeeper aims to give the bees an abundance of room for the storage of honey, which in turn will do much to control swarming.

In many cases, the work connected with the first period may be done in the fall. At that time, the honey producer should see that every colony of bees has a young queen bee. Queen bees may be reared by the owner or purchased from regular breeders. The next requirement is to see that every colony has plenty of honey for feed during the winter and spring. This is arranged for when the surplus honey is being taken off the hives during the summer or fall. If the full quota of stores is not left with

Molting

The natural process of renewing the feathers is perhaps the chief concern of poultry keepers at the present moment. Undoubtedly the hot, dry summer through which we have passed has caused many early molts, but, as a general rule, molting does not take place until about the end of August and September, and it is a recognized fact that the most valuable birds do not molt until late in the season. Take, for example, the hen that has the highest in-

dividual egg record of the flock, ninety-nine times out of a hundred it will be seen that she is a late molter, and it is very often the case with a large number of the best exhibition birds. There is also another class of birds which requires attention as regards their feathers at this time of the year, and they are the youngsters which are entering upon their adult plumage, writes Searchlight in the Feathered Word, England.

Perhaps it is not usually conceived that the feather is a "hardy animal," yet it is so, and if poultry keepers would bear this in mind there would be fewer protracted molts than there are now. A rapid molt means a success commercially, whether birds be kept for exhibition, breeding or egg production. It may appear difficult to treat feathers like flowers, but yet it is simple if one remembers that the bird is the soil from which the feather grows, derives its sustenance and eventually dies to make room for a new growth.

The importance of proper treatment during the growth of new feathers is vital to the success of the branches mentioned above, and to them we may add table poultry. Anyone who has killed and plucked many fowls knows the difference it takes in time

Ninety-one big colonies of producing bees.

and trouble in preparing a quantity of fowls that have been improperly treated to a number that have been correctly reared, the difference being noted not only in quality and profusion of feather, but in the difference in the size and flesh of the bird. In a nutshell, the secret of good plumage is keeping the birds in good condition right from the time they are hatched.

Feathers act as a protective garment to the fowl from the weather. Thus it is evident that a good growth of feathers means warmth in the cold months of the year, and warmth in the winter means winter eggs. Nature has provided birds with the lightest, yet warmest, equipment that is possible, light owing to the bird's great activity and warm because of its small size and great productivity. Yet the bird can adjust this covering to a very large extent to meet the requirements of the weather. To prove this, watch a fowl's plumage during hot and cold weather and note the difference.

Feathers do not interest the utilitarian as they do the exhibitor and breeder of fancy fowls, for this class of poultry-keeper depends almost entirely upon the color and marking of the feather, whilst the fatter, beyond their market value, considers feathers, as the writer has done on many occasions, a general nuisance. "But what can't be cured must be endured," and that advice we give to the poultry keeper who caters for the table chicken is to grow white feathers, as they command the best prices.

There are many varieties and forms of feathers, yet their composition is the same; feathers are made up of quill, shaft and web. The quill is a horny tube which attaches the feather to the skin. It has a small opening at either end, where it is attached and where it merges into the shaft. The nutrient vascular pulp is contained in this hollow tube during the growing stages of the feather, which it draws from the body to feed the remaining portion of the feather. When the feather is fully developed the inside of the quill becomes, by a gradual process, almost empty, the pulp or sap which it contains is drawn into the feather, leaving nothing but a dry, shrivelled pith. At this stage the feather is no longer nourished by the body, because the bird is making preparation for a new growth of feathers. This prevents the old feathers from obtaining nutriment, and causes their death and falling out. The young ones take their place, and they in turn go through the same stages. Nature thus replacing annually the old worn and torn garments by a new one which the bird requires to withstand the cold months of the year. It must be obvious, therefore, that the better condition the bird is in during the growth of feathers the better they will be, not only in quality but also quantity.

The shaft of the feather is a continuance of the quill. It is a spongy structure, beneath a thin horny covering. In shape it is flat sided, with a convex back, and grooved on the underside. From these flattened sides spring those delicate fibres called the web or plume, and also the fluff. This web, etc., consists of numerous barbs interlocked by means of minute processes termed barbules; in many feathers the base of the web consists of loose free soft barbs. This is, of course, the fluff. Few poultry keepers take the trouble to examine carefully the formation of their bird's feathers; a feather, when closely examined, especially by the aid of a microscope, is marvelously formed. The hundreds of small fibres is simply astounding, and each barb is practically another small stem attached to the main stem. These barbs gather, as we have previously seen, their life from the main stem, and their colorings and that of the fluff are derived from pigments existing in the blood of the birds.

There are various sizes and shapes of feathers, and, as might be expected, there is usually a marked difference in the feathering of the sexes, and various breeds. But in general the feathers peculiar to different parts of the body follow a similar outline. The names of these different feathers are familiar to the "old hand," but for the benefit of the novice we give a description of them here. The long, narrow, pointed feathers of the neck are termed neck hackles and those upon the posterior portion of the male's back, which are more tapering in form than the neck hackles, are called saddle hackles. The saddle of the cock corresponds to the cushion of the hen. The true tail feathers are the ones that stand out straight and stiff in the tails of both sexes, but the large curved feathers of the tail in males are termed the sickles. The softer, smaller, curved feathers at the sides and bottom of the tail are the tail coverts.

MILLER'S IDEAL Mammoth Incubators

It's The Talk of the Country—By J. W. Miller

West Manchester, Ohio
May 21, 1922
J. W. Miller Co.,
Rockford, Illinois.
Gentlemen:

I am writing to tell you of the success I have had with my Ideal Mammoth Incubator, 3400 egg size that you installed for me last season. This incubator has given universal satisfaction.

My hatches have been right around 90% and the chicks are the strongest, healthiest and best I have ever seen in my experience in the poultry business. Recently in taking off a hatch of 700 chicks I had only one cripple, which, I believe, is a record and to say that I am more than pleased with the results in using my Ideal Mammoth Incubator and with the wonderful service I have received at your hands is putting it mild indeed.

I contemplate doubling my capacity this coming season and you may rest assured that it will be an "IDEAL."

With kind regards and cordial good wishes, I am
Cordially yours,
J. G. FRANK

Yes Sir! Poultry experts from Maine to Texas say Miller's Ideal Mammoth Incubator is the best they have ever seen.

It should be! Into it has gone the accumulated experience of a lifetime devoted to building good incubators; of constant experimenting to develop new and exclusive time and labor saving features.

Improved scientific heating system—Perfect Radiation, Absolute control of Temperature, Moisture Distribution and Ventilation. Positive and convenient turning of eggs, unit form of construction—these are some of the

features that can be found in Miller's Ideal Mammoth Incubator—features that put certainty into hatches and guarantee maximum profits.

Don't go along with an ordinary incubator when you can make more money with Miller's Ideal Mammoth. Be guided by the experience of poultry experts who have put my incubator to the test. Read Mr. Frank's letter at the left—it tells the story.

I have a mighty interesting proposition to make. Let me tell you about it. Write at once for complete details.

If in a hurry wire!

J. W. MILLER CO., Box 2, Rockford, Ill.

The Magic Coal Burning Brooder

A money maker because it is a life saver to chicks. Chick welfare depends on uniform temperature and pure air. The Magic regulates with clock-like precision being equipped with both top and bottom automatic draft. Cuts chick mortality to 5%. Free from gas. Write for catalog. Agents wanted in territory not taken.

White Orpington Show Room Winners

COCKS HENS COCKERELS PULLETS BREEDING PENS
We now have cocks and hens in new feather, ready for the show room. Our early cockerels and pullets have size and finish and are fully up to our highest expectations in quality. We are making decided concessions in prices this year because of our reduction of farm expenses. Write for our catalog and special sale terms.
J. S. MORRIS, Manager and Owner.
LEBANON, OHIO

Secrets of Expert Exhibitors and Easy Lessons In Judging

By FRANK HECK

The time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables him to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest faker and you need it to put yourself on an equal footing with your honest competitors. It will show you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system of so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! Don't put off sending your order. You need the book NOW. The price of the book is, including postage, \$2.00.

AMERICAN POULTRY JOURNAL

523 Plymouth Ct., Chicago, Ill.

The American Breeds of Poultry

Every American Breeder Needs This Book

By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages, 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Pencilled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Pencilled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

Price, Postpaid, \$2.00

AMERICAN POULTRY JOURNAL

523 PLYMOUTH COURT, CHICAGO, ILLINOIS

The first 10 flight feathers of the wing are the primaries, the next 10 (approximately) are the secondaries. These cover the primaries when the wing is closed. The wing bow is composed of the feathers on the entire shoulder part of the wing. The broad feathers which spring from beneath the wing bow and cover the roots of the secondaries are the wing coverts. The markings of these wing coverts is usually termed the wing bar. The characteristics of the breast feathers are similar to the back and flat of the wing.

Cost of Producing Eggs

I noticed an article in A. P. J. early this year, which set forth the claim that the author produced eggs at a cost of 9½ cents per dozen.

I believe in addition to deceiving herself, the author is doing many a beginner or prospective beginner a great deal of harm because it is just such glowing and receptive articles that induce many of the new poultry keepers and would be breeders to enter the business because it looks as though there must be an enormous profit in it, if you can produce eggs for 9½ cents and sell them for fifty cents to one dollar a dozen depending upon the season and location.

I will give you an account of certain poultry keepers who really make any very wide margin of profit on their poultry if they keep any where near a true account of costs.

Mrs. Poe does not say anything what it cost her to produce the pullets or hens from which she got the eggs at 9½ cents per dozen.

I will give you an account of a certain flock of chickens which I raised, to prove my case.

I purchased fifty (50) day old White Wyandotte chicks at 60 cents each. I raised all of these and when they were 5 months old I had 28 pullets and 22 cockerels and when I recapitulated my account I found these fowls had consumed \$94.81 worth of feed and it had taken five gallons of oil to brood them at 24 cents or \$1.20, total of \$96.01 plus the \$30.00 I paid for them or a grand total of \$126.01 or \$2.52 each. I sold stock to the value of \$57.50 used for food to the value of \$43.65 and selected 9 pullets which laid during November, December and January a total of 612 eggs which I sold for \$41.65 and on February 1st I sold these pullets with a cock bird that I paid \$18.00 for to a party for \$42.50 or a total income of \$185.30, less the \$18.00 for cock bird of \$167.30, my actual cash outlay \$126.01 plus \$7.92 for feed for the 9 pullets from October 1st to February 1st or a total of \$133.93 or a net cash return of \$33.37. This you will note makes no allowance for my labor and trouble nor does it allow anything for use or depreciation of equipment. We did not use a single egg produced in these three months as I had a flock of Light Brahmas that kept us in eggs for our own use.

I have spent considerable time and money in breeding various breeds of poultry in my small way and I am pretty well convinced that it costs the small breeder pretty near to 32 cents per dozen to produce eggs taking all things into consideration. This of course can be lowered where you have free range but on a city lot my figure stands.

I would like to hear from some more small breeders who keep accurate records on their costs and returns.

I had a small pen of six (6) Light Brahmas that showed me a money profit of \$56.00 in two years but that was due to some very extraordinary circumstances that may never happen again and was partly due to some very prominent free advertising that I received.

This letter is not written as a "knock" but rather to correct any too optimistic view some poor fellow may get from reading an article headed "Eggs at 9½ cents per Dozen," and I am sure Mrs. Poe did not intend it to mislead any one, but many people leap first and look afterwards and that is where so many failures occur, and if this letter makes even one prospect hesitate and analyze the proposition before he starts then I shall feel well repaid for the time and effort expended.

Penna.

F. L. Steiber.

Bare Backs of Hens

It is quite natural for hens to lose feathers on their heads and backs at this time of the year, and bare backs are not uncommon. This is due to the activity of the male. Bare backs are especially common when the hens are closely yarded. The plumage will grow in again in the course of the molt.

Why Many People Fail With Poultry

During the last few years a great deal of interest has been shown in all branches of poultry keeping. The breeding standards have been raised and pure bred stock has become the rule rather than the exception. Therefore, there is a great demand for high grade stock of all breeds.

This has led many people to take up poultry keeping; some started with small backyard flocks of only a dozen birds. These birds were given the best of care in every way and as a rule did well during the winter months, often laying as high as one hundred percent. This led people to think that they could get rich quick with poultry.

Many of these people spent large sums of money and entered the business but to their great sorrow they found that when they had large flocks of one hundred or more they needed more care than the small flocks in the backyard. They found that they could not feed them in the morning and be away all day, and have the hens do well, and that they could not get as high as one hundred percent production.

The other reasons why many people fail is because they do not invest wisely. Many people think they can purchase stock and chicks very cheaply and still get stock that is of the best grade. I have heard many people laugh at a person who paid as high as fifty dollars per hundred for day old chicks or fifty cents to one dollar a piece for eggs.

They said that they could not see the difference between that kind and stock that could be had for about one-fifth of the price.

Many people say that the cockerel never walked that was worth more than five dollars and that the one who paid more was crazy.

I know a person who keeps poultry who is in the class mentioned above. He was afraid to invest any money. I am very much interested to watch this person's flock as I pass his home about once each day.

He keeps about two hundred low or cheap grade S. C. White Leghorns, which he keeps in poorly lighted houses, and his flock contains birds of all sizes and shapes, the hens never lay during the winter months.

This gentleman raises his own chicks and he will not pay more than \$1.50 for a cockerel. He says that only fifty percent of all the eggs placed in the incubator would hatch and that if one raises fifty percent of the chicks, he said that these percents were very high.

I was very much amused one day when I was returning home with a high grade ten-week-old cockerel that came from one of the well-known breeders. The flocks from which I purchased the cockerel cost \$55 per hundred and I paid \$5.00. I was amused to find the above named man at the gate. I showed him the cockerel, he spoke very highly of the bird and asked me how much I paid. I told him and he nearly fainted away and said that I paid too much.

In closing I might say that the best way for people to start with poultry is in a small way until they have learned the ins and outs of the business.

I think that today poultry in New England will pay better than any other branch of farming.

It is my idea that a person had better have five good fowls than twenty poor ones, as I think in the long run the best stock that one can buy is none too good.

—Thomas B. Field, Vt.

Capons

The valuable and interesting article on Capons by Mr. Chamberlain in the August issue was read with interest, but why after such an article do you or the writer caution the unwary reader about the dangers when a novice attempts this work? It is a well known fact by all who have tried the work that, this unsexing of the male as you call it, weakens its vigor to such a degree that they require additional care and especial attention.

It also makes them far more susceptible to disease and through this weakness, the health of the rest of the flock becomes endangered. So when an article recommending this work be published; that the person who does follow the advice may not become thoroughly disgusted with both it, and the poultry business, a cautionary word should be added.

In our town we had a fancier who was very enthusiastic and won prizes at the State Fair. He tried caponizing, not knowing the dangers, and introduced row into his whole flock. He is now entirely out of the poultry business, disgusted with his losses and disheartened by his failure. All because he knew nothing of the weakness of the capon and failed to give it the needed care that the accustomed raiser uses.

The writer should insist that the capon be given separate quarters, for even the pullet will mistreat and overrun him and the young cockerel will keep him away from feed and water. The capon, like the Indian squaw, will have to take all the rough treatment and "the coldest seat in the wigwam will be his place." He is the prey of all mites, mosquitoes and disease, and will communicate all such to the rest of the flock if permitted to associate with them. They are dangerous and deadly, ask any who has tried them and failed to give them the proper attention.

It were better by far, to kill and burn, or feed to the other chickens, all cockerels that one does not mean to keep; than to caponize unless one can care for them as they should be cared for, especially in our warm climate where mosquitoes, roup, canker and chicken pox prevail. Regions free from these pests might do otherwise, but here caution must be exercised.

Now, the writer knows that caponizing is a good thing and a work that will add greatly to the profits in poultry, but it is equally true that unless they are given the added care they require, they will not be a source of income, but a menace to the work. Be sure to impress this upon the novice and do not have any one make that old disgusting statement, "There is money in the poultry business for fools have put it in," but rather have them say that men of ability and not faddists rule in the business.

It is with pleasure that your stand on practical things is noted and while we are a fancier, purely, we are glad to note that the utility is so prominently placed in the American.

—L. E. Rauch, Ills.

What A Novice Can Do

Late in the summer of 1920, when I married a farmer, I knew very little about chickens—hardly knew there were different breeds. With the exception of summer visits to the country, I had lived my life in the city.

My husband had purchased fifty day-old S. C. W. Leghorns in May and raised thirty-three of them, twenty-two of which were cockerels! These we used for Sunday dinners all Fall. He had little time to give the babies and no proper facilities. When they were two months old he let them hunt for their own food, but they had free range in a field of oats and clover. In October, I began feeding them a little grain and then read articles in the farm papers on all phases of the subject. My reading did not, at first help me in caring for them, as I could find no definite information about feeding.

In November, I visited in Washington. While there I called upon the Department of Agriculture for help and got some definite feeding instructions. I studied their bulletins faithfully and as soon as I got back home, I sent in an order for feed—crushed corn and oats for scratch grains; cornmeal, bran, middlings, meatscrap and charcoal for a mash and oyster shell. From a neighbor who had sold his farm and did not want to move all his chickens with him, I was able to purchase ten fine pullets of the same breed at a reasonable price. This gave me twenty-one birds.

My feed came and I mixed a mash according to one of the government formulas. I kept this in hoppers before the birds at all times. At noon I moistened a small quantity of it with warm sour milk and fed them just what they would clean up in a few minutes. Night and morning I fed the grain in a litter of straw. I had plenty of sour milk, charcoal, fresh water and oyster shell before them.

From what I had read, I felt sure they needed a better house for winter. The wide cracks in the one they were occupying let in drafts. I persuaded my husband to let me use the garage, which he was using only as a storage house. He made nests and roosts and made an opening on the east. The big doors faced the south and made it impossible to have the opening on that side. I sprayed the inside of the building with whitewash and covered the floor with straw. This made a good, dry and comfortable poultry house. Before putting the birds into it I used sodium fluoride on them and got rid of a few lice they had. I now watch my birds carefully and have never, since the first treatment took effect, found lice on any of them.

They began to lay just before Christmas. I was decidedly excited when I found the first two eggs, for two were laid on that first day! In January they really got down to business. Our neighbors were all astonished at the success I had. For three months they averaged fifteen eggs a day, later thirteen and nine-tenths eggs a day. This from twenty-one hens.

This shows what can be done with chickens and I should like to stop here, for I haven't done so well this year! However, I believe I know why and hope to rectify conditions so that I will be equally successful, or more so,

Laying Hens Must Have WATER

Chemical analysis of fresh eggs reveals the fact that in egg-production feed counts 26% and water 74%. So when getting your pens ready for winter layers, don't forget proper watering equipment. It is the most important factor in the profitable production of winter eggs.

The problem is to keep water available at all times regardless of weather, and at the right temperature to induce your layers to drink the large amount they need to make eggs. The NORWICH AUTOMATIC AIR-LOCK FOUNTAIN does it. It means money in your pocket to investigate. A booklet is yours for the asking.

SMOKE-EM

CANNED SMOKE

THE GUARANTEE ROUP CURE

was discovered on our breeding estate, where we breed registered Holstein cattle, Spahr's Giant Epochal Berkshire Hogs, and our World's famous NONESUCH, FER-RIS WHITE 300-egg strain Leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria and Chicken-pox. After discovering and using "SMOKE EM," we have not lost a complete cure or every cent of your money back. Read what a national known breeder has to say about "SMOKE EM." "We carry 5,000 chickens on the farm. In one small house that contained 150 pullets the roup broke out. We removed 40 pullets that I would have gladly given to anyone who would have taken them off the farm. We used one can of "SMOKE EM," three smokings and strange to say it cured all of the forty head. You have a wonderful roup cure." The Henckle Farm, Per J. R. M. Boyd, Cumberland, Md. Write or wire us for particulars. Dealers, we have a good proposition for you.

Poultry Books at a Cut Price

A complete poultry library that covers every phase of the industry. \$5.00 complete poultry library for only \$5.00. A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and by taking them all at a cut price, you will be well equipped to make a success of this business.

Save One-third by Ordering Six or More of these Books Now

How to Raise Chicks, by Dr. Prince T. Wood. A down-to-date manual on breeding poultry, getting hatchable eggs, incubation and brooding, both natural and artificial, preparing chick foods, feeding chicks, how to raise chicks and how to avoid and prevent diseases and losses. Tells how to make your own brooders and chick foods. 128 pages, 35 illustrations. Price 75c postpaid.

999 Questions and Answers, by Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted of poultry authorities. It gives you the desired information and right to the point. 124 pages, 75c postpaid.

Poultry Account Book. This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. A guide to making your business more profitable. Printed on paper suitable for ink. Price 25c.

Open Air Poultry Houses for All Climates, by Dr. Prince T. Wood. Tells plainly just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the kind of houses used and recommended by successful breeders. 75c postpaid.

Origin and History of All Breeds of Poultry. Tells you where the breeds originated, what varieties were crossed to produce certain qualifications in a new breed; how they were recrossed until perfect. Postpaid, per copy, \$1.00.

A Revolution in Egg Production, by George C. Newell. Read this book and learn how you can lengthen the hen's working day in winter by the use of lights in the hen house when egg yield is lowest. It shows how you can increase the Winter egg yield 100 per cent. Cloth bound, \$1.00 postpaid.

\$4223.00 In One Year on a Town Lot, by H. Cecil Sheppard. Shows how with a very limited knowledge of the poultry business and small capital, he built up a profitable business. Cloth bound, price, \$1.00 postpaid.

DISEASES OF POULTRY

\$5.00

For these 10 Books

Diseases of Poultry.—Every poultryman needs this book. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. \$1.00 postpaid.

How to Build Poultry Houses.—A new book entirely different from our old book of similar name.—This new book presents the latest approved house designs of those state colleges and agricultural stations that have done noteworthy work along the big educational line of poultry house construction. This book contains the designs of those leading agricultural stations which have had the opportunity to study the problem in a big way for all poultry keepers. No one who is going to invest in lumber or labor should fail to secure this book. Handsomely bound in paper. Price 75c postpaid.

Why Poultry Pays and How to Make It Pay.—A book for the beginners in poultry raising and those who are interested in securing from the business the greatest profit obtainable. In this book you will find a complete discussion of the fundamentals that underlie success; the foundation stock; science in breeding; early hatching; chick trouble; importance of open air housing for growing chickens; early laying; artificial illumination to increase winter egg production. Paper bound and printed on special paper. 75c a copy, postpaid.

Cut Price for 10 Books \$5.00—Average 50 cts Each

This is a saving to you of one-third the regular price. If you have one or more of the above books, you can get the balance at one-third of the regular price by ordering six or more at one time. No order for less than six accepted at reduced price. Take advantage of this liberal offer today. If not satisfied with your bargain, return the books and we will return your money.

AMERICAN POULTRY JOURNAL, 523 Plymouth Ct., CHICAGO, ILL.

next year. I have had to learn some things by experience. I read so much about hatching chicks early, that I had fifty-one babies on the last day of February. These a neighbor hatched for me in his incubator, from my own eggs. It was a very poor hatch—fifty-one from one hundred and fifty eggs. I put these into a homemade brooder that I had had going for a couple of days, fed them rolled oats, a little grit, charcoal and sour milk, at first. Very soon I gave them a dry mash, mixed according to a government formula, and whole wheat. They always had sour milk. It was their only drink until they were two weeks old. I lost three of these. Of the remainder twenty-eight were cockerels. These I sold when they were just nine weeks old and weighed in all thirty-six pounds, two ounces. I got a good price for these broilers. The pullets began to lay the middle of July, when they were four and a half months old and laid very well for a time, but, of course, they moulted in the Fall, and I have learned that such early Leghorns do not pay.

In April I bought thirty-four day-olds for twelve dollars. They sent me thirty-seven and I did not lose one chick. Eighteen were pullets. Then I had a chance to buy a good incubator. Though it was late, I decided to try a hatch. I used my own eggs and got a 69 percent hatch. My brooder was not large enough for so many chicks though and I lost about a fifth of these from over-crowding. They did not grow and develop like my first two batches had. I believe that was because they were so late hatched.

In the Fall I planned to put up a house, but materials were very slow in coming, then the weather turned cold and we are still waiting for an opportunity to put in a concrete foundation. I covered the outside of the first house with roofing and my husband added to it, so I have kept my eighty-five hens there and in the garage this year. They have been too crowded and have not anywhere near come up to last year's averages. At present I am averaging four dozen eggs a day. I believe I will do much better next year with the new house and a well culled flock.

I have been able to sell all my eggs to friends and relatives in the city, shipping by parcel post and getting city prices for them. I have also been able to sell dressed poultry by parcel post and get good prices for it.

Since January, 1921, my poultry has paid for itself, for raising chicks, for the incubator and for our household expenses. I expect them to pay back the money I borrowed to put up their house this year.

—Gertrude H. Webner, Va.

Summer Egg Yield

With the approach of Summer, the poultryman's problem is not so much to get more eggs this week than he did last but rather to recognize the fact that hens will lay less eggs from this time on to the end of the laying season next October. Good management must be practiced during the Summer months in order that the inevitable slump in egg production shall take place gradually instead of abruptly. The maximum number of eggs cannot be laid by hens unless they are supplied with abundance of green food, suitable shade, cool and comfortable sleeping quarters and houses that are free from mites. These are some of the factors that every poultryman must keep well in mind during the Summer season.—Connecticut Agricultural College.

Intestinal Worms

An epidemic of intestinal worms is a pretty hard thing to overcome. If the ground becomes infested with the eggs of worms it takes about two years to clean up this ground and during this time the ground should be cropped and absolutely no chickens allowed to run on it. It appears there has been considerable trouble with worms this year.

Early Crowing Cockerels

On May 15 we hatched several hundred S. C. W. Leghorn chicks (American type). On June 6th we saw two of these cockerels crow. On the 24th day we had dozens of them crowing. In the past twelve years the writer has noticed many cockerels crow on the 28th day. M. M. Vickrey, Mo.

For eye trouble in little chickens make a saturate solution of boric acid, to which a little baking soda has been added. Swab each eye, using a clean piece of cotton in treating each chick. If the same piece of cotton is used on more than one chick, it may carry the infection.

As a rule it does not pay to doctor sick chickens. Find out the cause, then correct that wrong condition.

HOGAN SYSTEM

The famous book written by the late Walter Hogan. Contains the results of his lifetime of work and study. Full details on measuring for egg capacity and breeding for egg capacity. The entire Hogan System, fully illustrated. This book is entitled, "The Call of the Hen."

AMERICAN POULTRY JOURNAL, 523 Plymouth Ct., Chicago, Ill.

Classified Advertisements

Under this heading ads will be inserted for eighteen cents per word each month for less than three months, or forty-five cents per word for three months. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under classified headings. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from American Poultry Journal than from any other poultry journal—none excepted. On writing any of these advertisers, mention American Poultry Journal. All copy for Classified Ads must reach us by the 17th of month preceding date of issue. These rates void after May 20th, 1923.

Open Air Poultry Houses 999 Questions and Answers

By Dr. Prince T. Wood. Tells plainly and in detail just how to build Open Air Poultry Houses, and what to build of, so that anyone can readily construct the correct house used and recommended by the most successful breeders. The best and most practical work on the subject. 48 illustrations of poultry houses, plans and diagrams, and photographs of construction work. Shows how to care for your houses and fowls to get better poultry, greater egg yield and fertility and freedom from disease. Price 75c, postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

of poultry authorities. It gives you the desired information in a few words, and right to the point. Contains such subjects as the fancier, eggs, feeding, caring for chicks, the hen and how to buy, natural and artificial incubation and brooding turkeys, ducks and geese. Price, 75c postage paid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill. By Frank Heck. No matter what question arises, this book gives you the answer. It eliminates theories, and gives you "hard, cold facts"—positive conclusions arrived at by the actual experience of the most noted

OAK DALE Successors to D. W. Young and Owen Farms S. C. W. Leghorns FARM

New Fall Catalog Free!

The owners of Oak Dale respectfully call your attention to the fact that Oak Dale Farm is the home of the original D. W. Young and Owen Farms S. C. White Leghorns.

No other breeding establishment in existence has as much of this world-famous blood. Oak Dale blood is supreme because it is 100 percent Young blood.

When you order stock from Oak Dale you get not only fowls that individually are equal (if not superior) to the best any other farm can offer, but in addition you get fowls backed by 20 years of breeding by D. W. Young. And if you order a 1922 cockerel or 1922 pullets you get all that plus the personal selection of Harry M. Lamon, one of the greatest, if not the greatest, master breeders in the poultry industry.

Oak Dale's 1922 breeding pens (matings by Mr. Lamon) have produced literally hundreds of individual stars..... youngsters with wonderfully long, sweeping body lines, near-perfect head-points, and beautiful, glossy, snow-white plumage. There are thousands to select from! Breeders everywhere are delighted with them. Read what they say, judge for yourself.

W. J. Manby, LaGrange, Ky., writes, "The cockerel arrived Wednesday in fine shape. I am not only pleased, but delighted with this wonderful bird. He is far beyond my expectations."

Mrs. Arch H. Drake, Box 704, Granville, N. Y., writes: "The best two pullets were entered singly and won 1st and 2nd prizes. One of our own old hens won a 1st also. We are much pleased with the birds. The cockerel did not arrive in time to show. We have never seen a better young cockerel—he might be called a perfect bird."

Did you notice in the letter written by John H. Davis, Peterboro, Canada (published on page 801 of the August issue of this Journal), how Mr. Davis was especially pleased with "the striking resemblance" among the birds we shipped him? Did you also note that Mr. Davis especially remarked that the birds it was our privilege to ship him "certainly bore the earmarks of scientific breeding" and that "the value of such birds in building up a flock for the beginner can hardly be estimated in dollars and cents?"

There's a reason for these friendly letters, and the reason is Oak Dale Farm is pledged to give "more than the customer pays for." If you are interested in S. C. White Leghorns which combine beauty Standardbred show merit and heavy egg-production, write for Oak Dale's 1922 Fall Catalog, read the story it tells, study the illustrations and judge for yourself. Remember Oak Dale now has thousands of youngsters bred from the world's greatest foundation stud from sires and dams mated by Lamon, "the master breeder"—and you can have your choice. Come to the farm and make your selection, or, if you prefer, send Mr. Lamon instructions as to what you want, and trust to his judgment—you'll get a square deal either way. Write for your copy of Oak Dale's new 1922 Fall Catalog before they are all mailed out.

Oak Dale Farm, Box A, LeRoy, Minn.

Harry M. Lamon, Manager

Human Interest

Above is portrayed one of the greatest Leghorn breeding cocks that ever lived. He is absolutely 100% pure D. W. Young blood; a wonderful big stud bird, with 10 generations (20 years) of Madison Square Garden winning ancestors back of him. As a breeding stud he is too valuable to risk in a show. Per pound live weight he is as valuable from a breeding standpoint as is Peter the Great among trotters, Sir Pietertje Ormsby Mercedes 37th among Holsteins or Laet among Percherons.

The greatest Leghorns that ever lived are in his pedigree. And he is transmitting to his progeny what he has inherited, because, after all, he is merely an omnibus in which his ancestors ride. Nothing can be transmitted that is not inherited.

Come to Oak Dale Farm and see him and the 60 oldest cockerels he sired this year. Then you will understand why Oak Dale is a breeding establishment and not merely a place where Leghorns are hatched and reared. And remember this great stud bird is only one of 25 "star" breeding cocks used this year. Come and see thousands of big, sleek, full-bodied, racy-built, smooth-feathered, glistening-white cockerels prancing around chock-full of pep and so fearless of man that they will pose after 10 minutes of coop handling. For an average sample, look at the baby cockerel (4 months old when this amateur snapshot was made) pictured below. Notice his size, and width of back, and finish of saddle hangers. And remember his dam was an "over" 200 egg hen of pure Young blood. He is not the best cockerel on the farm. By October 1st a hundred others will beat him. He was merely picked up and photographed; merely a nice, average baby cockerel.....but that 20 years of line-breeding behind him will mean something to the man who breeds from him or any one of his thousands of close relatives now ranging over the clover fields on Oak Dale.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World
**Madison Square Garden
New York, 1920 and 1921**

The Greatest Record of All Time

First Prize Imperial Ringlet Cock at Madison Square Garden, New York—the blood of this great bird is all through my Special Sale List.

Every Prize and Ribbon Offered

Cocks	- - - -	1st, 2d, 3d, 4th, 5th
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th
Hens	- - - -	1st, 2d, 3d, 4th, 5th
Pullets	- - - -	1st, 2d, 3d, 4th, 5th
Young Pens	- - - -	1st, 2d, 3d, 4th, 5th
Old Pens	- - - -	1st, 2d, 3d, 4th, 5th

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

**Supreme at Madison Square Garden
Is Supreme Everywhere**

BARGAIN SALE FOR 1922

My Special Sale List is now ready and offers the most extraordinary bargains in extreme high quality breeding and exhibition birds of First Prize Sweepstakes Champion Madison Square Garden blood. **THIS IS YOUR OPPORTUNITY** to secure Madison Square Garden Winners, and sons, brothers, sisters and daughters of these winners, and birds of the richest First Prize Sweepstakes blood at prices **FAR BELOW THEIR VALUE.**

FIFTEEN CENTS PER COPY

This "Add A Section" Idea Makes a **BIG HIT**

With Poultry Raisers

If you are planning hatches of from 220 eggs up to 1760, here is the machine that will just exactly meet your requirements—you can start with one section and add additional sections as you wish—you don't have to spend a lot of money to start—you can begin on just as small or large a scale as you wish, letting your incubator grow with your business.

The **MULTI-DEK** SECTIONAL

Sectional Incubator is the only one of its kind on the market—it was designed especially for the poultryman who wants to let his profits pay for his expanding business.

220 to 1760 Egg Capacity

From one to eight sections, each holding 220 eggs can all be heated with one heater. Each or any section can be operated independent of the others. The Multidek is designed and built correctly for perfect incubation—it will hatch every hatchable egg.

Automatic Egg Turning Tray

is a feature that is a very important one—it means a great saving in labor and insures accuracy in the turning of every egg at proper time.

You Can Have **HOT WATER** or **HOT AIR**

Multidek Sectional Incubators are made so that either hot air or hot water heating can be used—you have your choice. While some prefer hot water, others express a preference for hot air heating. Either one is equally effective—it's simply a question of choice.

Six Sections

We furnish the Multidek—any size you want—from one section up to eight. We ship you the lumber all cut, fitted, marked and ready to put together. Any one can set a section up ready to operate in a few minutes.

For the man who is handy with saw and hammer and would like to save money by building his own Multidek, we will furnish complete set of plans with measurements and complete working plans so that you can build it yourself.

Mail Coupon for Prices and **FREE** Illustrated Folder

Fill out and mail coupon and get free folder telling all about this practical economical incubator. Folder tells how Multidek is made—how it is heated—why it hatches better—also low prices. Write today.

HOLTERMAN'S
"ARISTOCRAT"
BARRED PLYMOUTH ROCKS
World's Finest Strain

Another Sweeping Victory
G. E. Severance Writes Sept. 6, 1922

READ
These Letters

P. A. Bryant, California,
writes:

"Congratulations clear across the continent from one side to the other! In the strongest competition ever held at any State Fair in California, my 'Aristocrats' won First Prize Dark Pen, First Exhibition Cock, First Cockerel, and Second Light Pen. There were 140 entries in Barred Rocks alone."

W. D. Burtch, North Dakota,
writes:

"What do you think of this for a great laying record? From the three 'Aristocrat' pullets I received, in seven months, exactly five hundred eggs. Isn't that good? I feel that I surely have the record for laying in North Dakota." (This is an average of 167 eggs for each pullet for 210 days.)

J. Y. Stimmel, Ohio, writes:

"HAPPY NEW YEAR! WON FIRST AND SECOND PRIZE AT CHICAGO on exhibition cock birds. Both were 'Aristocrats.'"

A Great American Egg Laying Contest Official, Kansas City, Mo., writes:

"Dear Mr. Holterman: We find in checking up our reports that your 'Aristocrat' pullet No. 474 laid 262 eggs. This is one of the best Barred Rock records that we have ever had. I wish you would use the egg record of your females in your advertising. If you will use these records as you should, you will get as much value out of them as any winning you have ever made."

"I went to the Michigan State Fair with my Holterman ARISTOCRATS and won 1st, 2nd, 3rd, 4th Cockerels; 1st, 2nd, 3rd, 5th Pullets; 1st, 2nd Young Pens; 3rd Cock and 5th Hen." In the face of the terrific competition at this great State Fair Mr. Severance's winnings need no comment. In thousands of shows everywhere ARISTOCRATS prove themselves to be unquestionably the world's greatest prize winning strain fowls.

Prize Winning Show Birds

Able To Win In Any Competition

For years my ARISTOCRATS have maintained their deserved reputation for being surest winners at exhibitions and egg contests. Each year I improve my stock to a point that assures maintenance of ARISTOCRAT superiority, and in consequence my birds are able to win in any competition, anywhere and at any time. I can honestly say that at this time I have the

Best Birds of My Entire Career

Triple Profit Fowls

In my office I have records that readily establish the truth of the statement that ARISTOCRATS are the biggest "triple profit fowls" in existence. They not only win at the most famous shows throughout the United States and the civilized world, but are justly famed as egg layers and big money market fowls. These three money making traits, combined in one pure strain of poultry, spell success for you under all conditions. My limited surplus stock for October disposal is now offered for sale at reasonable prices while it lasts.

Wyckoff's S. C. White Leghorns

America's Business Hen

Their 42nd Year of Direct Breeding and Improvement

Acknowledged everywhere as the world's greatest laying strain—unequalled in standard qualities.

SPECIAL ATTENTION is directed to the fact that it has been proven, on careful investigation, that the world's greatest record flocks of high quality Leghorns have a foundation wholly, or in part, of this famous strain. Conclusive proof that they are THE GOLD STANDARD OF S. C. WHITE LEGHORN VALUE.

BREEDING COCKERELS

A wonderful lot of strong, vigorous, healthy, range-reared cockerels, all produced from a special selected lot of three year old hens representative of our highest quality. The blood lines you need to double the value of your next season's breeding pens.

Send for free descriptive catalog with numerous photographic illustrations of this most completely equipped plant, and Special Illustrated Cockerel Circular giving description of the different grades, with prices—prices that are most exceptionally low, when quality is considered. Place your orders at headquarters and get the best.

C. H. WYCKOFF & SON

Aurora, Cayuga County, New York

Four Incubators in One

Our "Four In One" is a BABY MAMMOTH. Has FOUR complete incubators IN ONE and heated with one heater. With this one section a hatch can be taken off every week or you can set FOUR different kinds of eggs at one time, as you choose.

"Four In One" 800-Egg Section

You can start with just one "Four In One" 800 egg section and increase the capacity, section by section, to a mammoth machine. It takes only a few minutes to add new sections.

Shipped with legs removed and will easily go through a 2-ft. door sideways.

7 Distinctive Features of the Schwalge Incubator

EACH EGG CHAMBER IS A SEPARATE UNIT, holding 200 eggs—in two egg trays for convenient handling. Trays may be arranged for PEDIGREE HATCHING, if desired. Any chamber not in use may be shut off by means of shut-off damper, thus saving oil.

PURE RADIATION HEAT. The heat travels through 4-inch heating tubes, giving a large heating surface and causing a mild heat.

MOST UNIFORM TEMPERATURE. The very uniform temperature in all egg chambers has won for the Schwalge an unexcelled reputation. The heat to the different chambers is controlled before it reaches the chamber (not afterward), which insures the most uniform temperature throughout.

EFFICIENT VENTILATION SYSTEM, independent of the heating arrangement and easily regulated. Makes the chicks strong and healthy.

MOISTURE GENERATOR for dry climates or high altitudes. Water is dropped on hot tube inside the egg chamber and evaporates.

HIGH GRADE CONSTRUCTION. Sound lumber, 28 gauge galvanized iron and a liberal amount of fire-proof asbestos is used in the construction of the Schwalge Machine. Packed well to hold the heat very steady.

MECHANICAL EGG TURNING DEVICE. Our new 1923 Model is equipped with a mechanical egg turning device. One simple movement of the lever turns every egg. Can easily be removed, if turning by hand is preferred.

SECTIONAL CONSTRUCTION

Enlarged to 9600 Egg Capacity [12 "Four in One" Sections]

You should buy the Schwalge Incubator because it has the strongest guarantee back of it, which eliminates all risk.

My Buff Orpingtons

Perhaps no line of Buffs in existence carries the purity of color now possessed by my Strain. By this I refer to the strength of undercolor in every section, the soundness in tail and wing color, the soft, even, level surface color of Females and the brilliant, sparkling, golden luster in Males. But this matchless excellence of color does not make a complete Orpington. I have always maintained and cautiously guarded massive proportions, large capacity, broadness with length, stout bone, proper station, neat head points and good length of feather. These balanced color and type qualities in my best Buff Orpingtons are the fruits of my 21 years of constructive and most cautious breeding. This matchless achievement accounts for my unapproached sensational winnings at the Great Chicago Coliseum Show past four years as well as my ability to serve you best in Buff Orpingtons

My White and Black Orpingtons

While I do not breed White and Black Orpingtons so extensively as Buffs, the very same basic principles of constructive breeding is utilized and I have quietly furnished many of the most sensational Winners in White and Black Orpingtons known to the American Orpington fancy. Prudent purchasers do not object to paying substantial prices when they get this quality and the

finest of my many years of breeding are now open to your purchase. My outstanding specimens this year carry the neatest head points, the greatest capacity, the broadest backs, the lowest tail carriage, the fullest breasts, the heaviest bone and the best station that I ever owned! My old customers everywhere will fully appreciate this news and will order early as usual.

In every single instance the quality will over-balance the price whether the price be \$5 or \$50 per bird and your complete satisfaction is guaranteed.

"You can't beat a Wishbone for Big Profits and Easy Handling"

LOOK at old Wyandotte. Last year someone kidded him to take a hundred mile trip to see some sort of a contraption that had done wonderful things *in the factory*. He fell for the smooth line of promises they gave him and bought the machine.

"Last hatching season I visited him. I thought he was going mad. Never a moment's peace—up night and day—always something going wrong. And you should have seen his chicks—all skin and bone!

Write for the New Wishbone Catalog

It shows plainly how the Wishbone increases your profit—and eliminates all hand labor. It describes in detail how hatching may be reduced to a few routine operations. You should read this catalog even if you aren't ready to buy an incubator at this time. Write for it now.

See How Satisfied Wishbone Owners Are

"You say I'm lucky. It's not luck—it's common-sense. I bought a Wishbone Incubator because I'd actually seen several Wishbone installations working and making big profits for hatchers whom I knew personally. You needn't go far to see a Wishbone. If you don't know where to go, write the company—they'll tell you. Better still, come and have a look at mine.

"Ask my wife her opinion. Last year when I fell sick she operated the Wishbone herself and she swears it tired her less than her housework. 'What is there to do?' she says.

So Easy To Operate

"Between ourselves I'm frank to admit the job's a light one. The heater only needs fuel about once in every twelve hours, and when you put your eggs on the combined hatching and roller trays your task's all but done. Rolling the eggs with the Wishbone turning device is child's play. It's all done in a couple of minutes—*rolled* mind you—not shifted on end. On the last day of the hatch, in every compartment, you'll see a picture! Crowds of 'Wishbone-hatched'—those heavy, fluffy chicks that people rush to buy because they live and thrive. No wonder I banked \$15,000 with my 40,000 capacity!

"And look at these new improvements in the 1923 Wishbone. Just read about this Hatching and Rolling Tray—this Temperature Regulator—and this Moisture Tray. I am buying more Wishbone sections this year. With hatching made still more easy and the day-old chick trade booming, I should be foolish if I didn't.

"You have to go easy—you say. Well, why not buy two sections as a starter and add to them as your business grows? No need to overbuy."

Owen Farms

*has stood Pre-Eminent as
a Breeding Establishment
for 17 Years*

During this period more than thirty thousand shipments have been made in the United States, Canada and abroad. Very few really good flocks exist that are not wholly or in part Owen Farms Bloodlines. Leadership over a long span of years has to be won on sheer merit. The established bloodlines at Owen Farms, where careful systematic line-breeding has been followed year after year, has been the big factor in the success attained by the many thousand Owen Farms' customers all over the world.

Owen Farms flocks have been bred to the highest Standard requirements for exhibition. They have been selected and bred in the same careful way for egg production. The wonderful prepotency of Owen Farms birds has enabled them to become dominant wherever they have gone. They have won the highest honors in the Show room and made records of over 300 eggs in 365 days in the trapnest.

Genuine value and "Golden Rule" treatment given every customer have been the basis upon which the permanent success of Owen Farms has been built. Am very proud of the hundreds of customers who come back from time to time when they need help. "One an Owen Farm Customer, Always a Customer of Owen Farm" has become a truism.

Down To Date Service

is at your disposal here at Owen Farms. Careful records are kept of every shipment, and you can come back at any time and secure the proper bird or birds to nick with those you have and go on with the line-breeding. My records are complete enough to enable me to visualize any birds shipped even though sent out some years ago. What I have learned during twenty-four years devoted to breeding Standardbred poultry is at your disposal. Am always glad to advise my customers, and, in many instances have saved them large sums of money. **Come and visit my farms if you can.** At any rate, come fully and freely on paper and learn for yourself if you awnt to become a member of the large and growing Owen Farms family.

1922 BUSINESS

will be large because the finest cocks, hens, cockerels and pullets ever on Owen Farms are rapidly rounding into shape to meet your requirements. Winning old and young birds for your show; superbly mated pairs, trios, or pens to produce strong sturdy birds that have the ability to lay and pay as well as to win; utility birds of the highest class; you will find them here on Owen Farms at prices you will gladly pay.

Splendid utility cockerels at \$7.50 and \$10.00; choice breeding and show cockerels at \$15.00; \$25.00 and \$35.00; superb exhibition and breeding cockerels at \$50.00; \$75.00 and \$100.00. Utility pullets at \$5.00 each and choicer pullets at \$7.50 to \$50.00, just half the price of the cockerels of the same grade. Choice cocks and hens a matter for correspondence.

Whatever you are needing you will find among the thousands of

Housing and Feeding for Winter Eggs

EVERYBODY who keeps hens should give advance consideration to the subjects of housing and feeding for the winter. Birds should be placed in their permanent quarters, given regular egg-producing rations, and started before the cold weather begins. Upheavals, such as change of houses or methods of feeding upset the birds and check the egg-laying machinery, once it is started.

For that reason the winter schedule should be planned in advance and should not be changed after it is once started. Early October is a good time to do what needs doing to the houses; it is the time to invoice your stock and decide how many birds you are going to keep through the winter; what feedstuffs and litter you are going to use. It is well to consider these matters now, and adjust and prepare for the winter season, thus being in shape to reap the rewards of the early egg market.

First I prepare the house. My poultry house, although plain and shabby, is storm-proof, clean and well ventilated, and that without much expense. The roof and sides are covered with a good roofing material. Early in October, on the first sunny, warm day, I clean the walls and all the inside fixtures, after which I put on a thick coat of whitewash, being careful to get it into all the cracks and crevices, for those are the places where vermin hide and breed. The house is then clean, fresh and dry, ready to receive the pullets.

The floor of the house where you keep your birds must also come in for its share of cleaning. The floor of my poultry house being of dirt, I scrape off 2 or 3 inches and cart in the same amount of strong clay soil that packs down to a hard, smooth surface. This is a laborious job, but important, for a contaminated dirt floor is dangerous to health. Fresh earth improves the sanitation of the house.

To ventilate an ordinary house like mine, is to take out the sash in half the windows at opposite ends of the house and cover the openings with burlap. I like to have one or two glass windows on the south or southwest side of the house, as they allow the direct rays of the sun to get in and the birds enjoy it in cold weather. I also have a frame door covered with burlap as well as the wooden door, as the burlap makes it possible to admit air and light and keeps out the snow and wind on stormy days.

Dry, Clean Litter

I have come to realize that litter for the floor is almost as important as the feed. Costly experience has taught me that any old hay or straw will not do for the hens to scratch in. Musty and moldy scratching litter causes more sickness among fowls than anything else, as it breeds disease germs, which float in the air when the hens scratch up the material, and rapidly develop diseases of the lungs and intestines. I use only

By Emil G. Glaser

The poultryman should consider winter problems this month—House should be ready and pullets started for winter egg production—Practical hints on housing and feeding.

the purest scratching materials obtainable. I have found shavings particularly valuable because they prevent the other litter from packing down, and so insure a circulation of air through the litter, which keeps it dry and sweet.

After my house is in shape, I decide how many pullets or old hens I can put into these quarters. Every hen and pullet is given the "twice

over" before it reaches winter quarters. Once, when the culls are thrown out, and again when only the best pullets or old hens are picked from those of the first culling. I am careful not to overcrowd, as I have discovered that there is nothing more detrimental to egg production as overcrowding stock in winter. I have found that twenty well cared for pullets, with plenty of house room, will produce more eggs than fifty that are crowded. Crowding pullets in winter quarters is a fruitful and virulent cause of roup, colds and general debility.

Having arranged the house and number of birds to be kept, general feed and care is the next thing I consider. Hens must have a variety of food to produce eggs in winter. These feeds when taken together are generally called "balanced rations."

My regular winter feeding program starts as soon as the pullets are placed in their winter quarters. I scatter one quart of scratch feed, composed of two parts coarsely cracked corn, two parts wheat and one part oats, in the deep litter, in the morning, for each twenty fowls. They have access to a good commercial dry mash at all times except at noon, when they receive a crumbly wet mash consisting of two parts wheat bran, one part each of middlings and cornmeal, one-half pint of meat scraps and boiled potato peelings.

An hour after this is fed I again open the dry mash feed-hoppers. I feed alfalfa because it is the best all around green feed to be had. I use the last cutting, which is fed in wall racks.

About two hours before dark I feed the same as in the morning, except that an extra pint is added to the quantity of scratch feed fed in the morning. During extreme cold weather I feed some whole yellow corn.

Warm water is as important a factor on my feeding program as the rest and is furnished at all times in heater fountains. I change the litter on the floor every two weeks and shake it up every day. My reward is plenty of eggs from early October until late July, which not only bring top-notch prices, but produce big, strong, healthy, robust chicks that live.

I repeat the danger of colds when pullets are put into ill-ventilated winter quarters. Keep windows open day and night during the fall. If a dirt floor, renew the dirt; or if a board floor, spray with disinfectant.

Great Poultry Show at New York State Fair

A GREAT poultry exhibition such as was staged on the New York State Fair Grounds, Syracuse, September 12th to 15th, 1922, is not merely a competition. It is an educational short course where those who attend learn by looking and seeing. For the show is a mirror that reflects, so all may see the true status of the breeders' work as the aggregation of breeds comes out of the breeding season of 1922, with the young stock of its lineage by its side. It is this young stuff that is always of special interest, for it is the season's first reflection of what breeders have accomplished in their ever forward and ceaseless cycle of breed perpetuity.

Syracuse is not an easy show to make. Coming the second week in September, many a good cock and hen is in bad feather, and only the earliest and best matured of the young stock is fit. It is remarkable how good the show really is. For it annually receives a big entry of superior quality stock. This steady strength of the New York State Fair is directly due to three things. First, prize money, which this year, amounted to \$5,830.50 in regular prizes, and \$1,083.50 in special prizes. Second, efficient management, which results in the proper cooping and care of the exhibits and the selection of a staff of capable judges. Third, a splendid poultry building in which to stage the exhibition.

Syracuse brings together many of the representative poultrymen of the country. It is a meeting place. That is an advantage that follows in the wake of big and important shows. When many of the leading poultrymen of the country get together, there is a most beneficial exchange of opinions. More than that, breeders are able to keep their friendships in constant repair. The world is a pretty big place; there is a great deal of work to be done, and most folks are kept busy with their work; but now

By Frank L. Platt

**Exhibit up to its usual excellence
—Young birds well developed—
Efficient management right
through—Fanciers are embody-
ing utility merit in their birds.**

and then there is a gathering of breeders in which each may live in the companionship of the others. That builds and keeps in repair the fraternal spirit of the fancy. It is this free-masonry which envelops the entire body of poultrymen that gives to the chicken business its good flavor and charming atmosphere.

The entry of chickens at Syracuse was about what could be termed "normal." There have been bigger entries at different times. It cannot be expected that the show will "break all records" every year. The strike in the railway shop crafts and the excessively hot weather that preceded the show were factors of influence in shaping the entry. From the conversations of breeders in attendance it was plain that optimism prevailed among them. One big poultryman stated that he was prepared for double the business during the coming winter and spring that he handled last year. An old acquaintance remarked that he had stopped to spend a day at the poultry show, being East on a business trip, and that on this trip he had sold 500 automobile bodies in one order. "A year ago at this time," he said, "I couldn't have sold three." Forty-eight per cent of the buying power of the country depends on the wages of employees, and the liquidation of wages has about reached its lowest level for the time being, while bank statements show an expansion of loans, which makes borrowing easy and stimulates business. These facts in the general economic situation indicate the abatement of pressure that has been in evidence, and, if things were more settled in Europe, would indicate boom times.

In going over the classes at Syracuse, we were impressed with much that could be termed good quality birds and much good judging. It does appear, however, that there are cases when the entry is small in a class that birds are awarded prizes that are not worthy (Continued on page 955)

A Program of Work that Will Bring Results

OCTOBER is an important time of the year for the poultry raiser, because it brings nearly to a close the producing year in his laying pens. The average pullet reaches egg laying maturity as the later days of October appear, and begins her season of egg production. With the rolling around of another October that pullet, if she has survived the culling operations during early summer, when a certain percentage of the unprofitable individuals are removed from the flock—reaches a natural period of rest and relaxation from intensive egg production, and enters the molt, changes her plumage coat, and gets herself in readiness for the following year's work. Therefore October is the natural time, and as a rule the most convenient time as well, for the poultryman to take inventory of his hens, to look over the individual fowls that remain in his adult flocks, and decide which are probably going to prove efficient and economical through another season. It is probably true that in many cases too many of the old pullets, which are soon to be classed as yearlings, are sold. Many a valuable yearling has been removed from the flocks, which would have made good money for her owner, if he had appreciated her worth and promise.

Hens That Are Useful

We hear much these days of the term, "utility fowls." What are utility fowls? No poultry raiser, whatever his particular line of interest in poultry may be, should be, confused in his conception of answer to this question. Utility fowls are simply fowls that are useful, and this is analyzed to include economical and profitable. Utility fowls are fowls that fulfill a purpose, supply a demand, earn returns on investment in them, and warrant their keeping. Every hen that remains in the laying or breeding flocks of American poultry yards this coming year should be in some way and in some measure an utility hen. The idea of what constitutes an utility hen may differ in various types of poultry production. To a suburban poultryman it may take the form of a hen which will lay a goodly number of eggs for his family use this approaching winter, or it may be a bird worthy of exhibiting in a poultry show. To a commercial poultryman, depending upon his poultry flocks for his income, it will be a hen capable of producing salable products economically and efficiently. Or to a fancier breeder the utility hen may be the hen which will best serve his purpose in the production of sound seed stock, true to type and color. The idea that an utility hen is simply a useful business hen should be emphasized.

Determining Usefulness

Practically every poultry raiser who reads this story is interested in determining the usefulness or business worth of the hens in his flocks. October is the time to make the appraisal of value. Before any attempt is made to sort over the yearlings and older hens, several important factors should be thought over, in order that in making the selection of hens to keep for another season more exact and accurate work may be done. In other words, there are reasons why certain hens should be kept. What are they?

Egg production is the basis of the American poultry industry. Without a certain capacity for egg production no breed of fowls will meet widespread favor, or be developed as a popular or commercial type. Some poultrymen specialize in certain branches of poultry production, such as the breeding of exhibition fowls, but their success lies basically, in part at least, in the productive capacities of the prize winning fowls which their skill as breeders produce. In the enormous poultry industry which touches every part of the country, egg production very certainly is the foundation of any permanence or business success which that industry enjoys. And this is undoubtedly as it should be. Therefore, it is not wrong to consider the hens' egg producing record as a major point in determining which hens remain and which are to be sold for meat purposes.

By Willard C. Thompson

Handle the hens this month for personal inspection—The practical use of leg bands on pullets and hens lead to a full knowledge of your birds.

The American poultry raiser is not a narrow-minded sort of person, and should not be. While realizing how fundamentally important must be the consideration of a hen's egg record, he does remember that certain other points should also be given weight when the snappy days of October remind him of his duty to the poultry flock. He may be tempted to give most of his atten-

tion to his incoming pullet flocks, and they deserve much of it, but a few hours must be spent with the older hens. It is a waste of money, time and labor to keep over hens that will not earn something that is tangible and useful. The size, condition, type, color, trueness to Standard, and appearance of the hens must be given consideration.

Suggested Program

In order to put these thoughts into form for practical use immediately, the following outline program is given, with the thought that any poultryman who will may read it over, think it out seriously, and then use it as a basis for looking over his hen flocks.

Plan to handle the yearlings and older hens sometime during October, preferably during the latter part. Systematize this handling so that every hen is individually considered, but so that unnecessary scaring or frightening of the fowls is avoided. Go into the poultry house some evening, catch the hens and confine them in crates, if possible, for easy handling the next day. It is preferable to combine this handling with the fall house cleaning, if possible.

If the fowls have been trap-nested during the past year the program is relatively easy, because the record in black and white indicates the whole story of the individual's egg production performance. Look over the record. Then handle the bird, and be sure that she is in health, remains vigorous, is fairly typical of her breed, at least, and does not possess outstanding poor qualities, such as deformities, disqualifications, decidedly off or poor color, or other damaging points.

In estimating, from examination of the trap-nest record, the value of any individual look to see if (a) the egg production record started early in the producing year, that is see if the individual was precocious, or capable of beginning her egg production during the season when eggs are high in price, and when it is not natural to secure high production, unless the fowl is well bred and managed. This means that individuals which have record of egg production during October and November or early December of a year ago can be considered precocious, and as a rule worthy of selection. (b) the egg production during March, April and May was heavy, averaging 25 eggs or thereabouts, for this means intensive laying, and as a rule marks an economical layer. (c) the egg production performance has been maintained well through the summer. The good, profit-producing hen cannot rest all summer and finish the year with a high egg record to her credit.

If the hens have not been trap-nested the selection must be based on less accurate items, but nevertheless made. The October selection of yearlings and older hens is in reality the last culling of the season. It is the estimation of hens worth by examination for certain marks that good production has left on the fowls.

Among the value helping points to be used will be: (a) Long, broad back, indicating room in the body for the use of large amounts of food materials, and the formation of eggs (but keeping in mind that in any breed this length or breadth of back must be in relation to the requirements of that breed. (b) Deep, capacious bodies. (c) Soft, pliable, high-quality skin (on por hens the skin is tight and rather stiff and hard). (d) Spread between pelvic bones, and between pelvic arch and end of keel, both further indications of development or egg producing organs. (e) Fade color in pigmented sections. In October the best hens will appear well bleached out in shank and beak. (Continued on page 946)

How the Big Poultrymen Succeed

FEW subjects hold an equal interest for a large number of American readers than that dealing with success and how to attain it. Sections of magazines are devoted to the biographies of the various men who have made a brilliant financial success in life, and their methods studied and followed as closely as the circumstances permit. Long advertising columns and many pages are devoted to the advertising of correspondence schools whose main object it is to develop and train men and women in various kinds of business in order to make them financially successful. This is a trait truly characteristic of our country, where Ambition rides in the saddle, and where the measure of a man is gauged largely by what he attains in the material affairs of this world.

For this reason I believe that the methods generally practiced by poultrymen who have made a conspicuous success of their business, will prove of considerable interest to readers of the Journal. Perhaps a brief analysis of the fundamental principals governing the rise of our notably successful poultrymen will be of assistance in enabling us to "go and do likewise."

Generally speaking, we find upon a closer examination that the main methods of doing business upon the very successful poultry plants are essentially the same. They differ greatly in application, but vary little in those foundation stones upon which every real and permanent business is built.

In order to attain a more intimate knowledge of this subject, I wrote a number of our really successful poultrymen, asking them to tell me frankly what main causes had contributed towards their success in their respective fields. The answers received were surprising in their variety in one sense, and equally so in their similarity in another. Practically every man has different ways of securing his business, but again practically each one bases his method upon a few simple principles. We are thus confronted with the problem of applying such methods as are best applicable to our particular needs and circumstances, rather than slavishly to follow the workings of another man's mind.

We usually note that the successful man in any line of endeavor is very much of an originator. He accepts the best others have to offer, and taking this as a starting point, branches out to suit his own conception of what is best for his enterprise. He is essentially a man of broad vision.

Essentials for Success

We may safely say that every successful poultryman loves his business. This is one of the true corner stones of real success with chickens. The painstaking care required year after year to produce an established strain of layers or show fowls, or both; the careful and intelligent combining of several strains to create a superior one; the sympathy, love, patience, and understanding—these are a few of the basic requirements for anyone in the poultry business, if he desires to emerge and stand above the mass of his fellow breeders. This I cannot emphasize too strongly. Do you possess these essentials? Or, given the opportunity, would you?

The histories of our successful poultrymen point to these facts very forcefully. In one instance we find a man leaving a highly remunerative profession, because, perforce: "I just couldn't keep away from chickens." In another case we see the traits descended from father to son, and often to grandson. Thus one of the tap roots of the success of such men sinks far into the rich soil of their love and sympathy for and understanding of poultry, its needs, limitations, and its possibilities.

Another essential we find is a proper conception of what

By H. G. Forster

The successful poultryman is in love with his business—He works with a will—The field is wide open to everyone—Rewards are high.

can be done by painstaking breeding. Witness the remarkable rise of some of our present show and laying establishments. Witness the equally rapid fall of some others. No breeder of any standing has attained his success except by the slow, sure, and careful process of selection, the almost religious avoidance of any-

thing not up to a standard set high and sure above the mediocre. I have in mind one West Coast breeder of heavy laying Leghorns who for years kept a painstaking and absolutely exact trapnested record of his birds, gradually increasing their capacity and prepotency until his fowls stand before the world as wonderful examples of what the mind of man can achieve if he sets about it in the proper way. In all those years, before the world and success came to his feet, did this man continue his work with unvarying care and conscientiousness—no wonder that the rewards are high. Never to be satisfied with an egg of inferior conformation, color, or ancestry requires real strength of character. Never to be tempted to increase a business until the flock produces eggs and offspring of the highest quality—no matter how keen the demand for that product may be—requires a conception of business ethics, vision, and ideals lacking in many of us. Do we possess them? This places such a man far above the mere honest poultryman. One can be honest enough and still not attain heights of real poultry success. Many poultrymen begin well. They build for themselves quite a reputation. Then the orders begin to pour in. The hesitation about sending back good money because one hasn't quite the proper eggs or stock on hand is human nature. It requires idealism of high order indeed not to lower standards. But we find that if this standard of quality be once lowered, it is practically impossible ever to recover from the demoralizing effects of easy and quick money. The pre-eminent poultrymen are those who have placed quality first and quantity second, and then stuck to it. Again I cannot emphasize this too strongly. Are we made of that kind of stuff?

Successful Business Methods

Let us enter the office of one of our successful poultrymen and glance over his shoulder as he runs through and disposes of his morning's mail. It is early February with orders for chicks and hatching eggs beginning to assume large proportions. He receives an inquiry which we will call letter one. It is from a wealthy man who is starting in the poultry business on a large scale. He desires 3,000 chicks of the best quality to be delivered the first week in April. Mr. Poultryman calls in his superintendent and they confer. They decide that they cannot supply this man with what he wants at the time he wishes it. They could place a lot of almost as good eggs into their machines, and perhaps none in this world would ever be the wiser, except the poultryman and his assistant. But what occurs? Mr. Poultryman dictates a courteous and appreciative reply to the effect that, while he desires this man's business, he does not feel able to guarantee so many chicks of the desired quality in the specified time. That, as a matter of fact, he would not advise this man to secure all of his chicks at the same time. That unless one understands the business thoroughly, it is best to have the chicks in at least three lots, separated by a week or ten days, to allow for more successful brooding, care and attention to details. In many cases the customer orders his chicks in this way, thanks the poultryman for his friendly advice, the chicks are delivered in rotation in smaller units, the customer is successful with them, is satisfied, and the farm, as well as the business in general, has made another friend. How (Continued on page 953)

What Constitutes an Ideal Market Fowl

By W. H. CARD

A big difference between chickens from egg-type breeds and those that have inherited flesh qualities—The requirements of good table poultry.

SINCE 1914 the breeding and development of meat fowls has become almost a lost art, but at present it is again coming into a popular favor which bids fair to rival the popularity of high egg production. One reason for this is that the meat side of the poultry industry is supported by steadier and more staple prices than the price of eggs.

With us in the East, eggs vary in price from \$1.25 per dozen to 25 cents per dozen, according to season or supply and demand. Poultry meat varies not more than five cents per pound either way in a year, because good table poultry is in demand beyond supply at all times of the year. That results in prices which enable the grower to produce market poultry at a living profit.

There is a reason for the renewed interest in the meat side of the poultry industry. The aftermath of war has created a new class of consumers who, of necessity, must make small cash purchases, and the one-fourth pound tea, the twenty-five cents worth of flour, small cuts in pork, lamb and veal, have resulted in poultry taking the place of big beef sirloins or porterhouse steaks. Poultry meat is not a high price delicacy as some assume. It is popular with the cash paying consumer of today. This situation, however, has developed a strong and insistent demand for a market fowl in dressed poultry of the highest quality; not a worn-out egg machine of a hen, but a big, meaty, economical chicken for the housewife to buy.

For many years poultry raisers made no great distinction between the egg and meat breeds, yet the enormous number of small, thin egg type birds that are now put on the market, and the good price for good table poultry has made a distinction a necessity. Any ordinary observer easily recognizes the difference between the Jersey cow (a milk producer) and a white-faced Hereford (a beef animal). Today the ideal market or meat fowl is as marked in its difference from the laying breeds as the above two breeds of cattle.

The shape of a meat fowl is rounded at every point, whereas the laying breeds are slab-sided and with angles predominating. The egg-type hen, when dressed and laid on her back, breast up, has a high breast bone—a sort of hatchet-shaped breast. The meat type hen has a rounder, flatter, plumper breast.

At the beginning of poultry culture, all fowls were of one shape or conformation. Then specialized breeds were developed to meet the desires and needs of eggs or meat. Today we have a number of general purpose breeds that combine both qualities to fair extent, and we also have breeds that are largely meat or largely eggs.

The different types have been brought about by continuous selection and line-breeding; that is, continuous selection and mating together of related specimens for an especial end in view, whether meat production or egg produc-

tion. In some respects the two types are alike in that both call for breadth, depth and length, but with great differences in the exact nature of that breadth, depth and length.

Difference Between Cornish and Leghorns

The Dark Cornish fowl is the extreme in meat type, the Leghorn the extreme in egg type, yet both must of a necessity have breadth, depth and length; but with the Cornish it is from the outside in, and in Leghorns, it is from the inside out, if I may use these odd explanatory terms.

The Cornish grows meat (not fat) on every section of such a thickness as to crowd the internal organs, hence, checking egg production. The Leghorn grows such large internal organs for digestion and reproduction, for high egg yield, as to make thin the walls of the body and take away from the flesh its meat developing character.

In considering meat breeds among recognized Standard fowls, one must, of necessity, choose those breeds signally

popular in respect to flesh quality rather than flesh quantity, together with those marketable qualities demanded by the fastidious American public, which embrace not only market-appearance and flesh quantity, but that an extremely tender fiber of flesh quality that is not only palatable, but can be well cooked, roasted or broiled to a "bite-ability" by the American "quick-fire" methods. The pulse of the market is in the palate of the consumer.

There is no 100 per cent perfection in nature and the chances are much less when

man undertakes to perfect anything in nature to conform to his desires and hopes. Man is not infallible. He may plan and put into operation those plans which he devises, yet his hopes may never be realized because of some imperfection in his own line of reasoning. With this preliminary apology for the best efforts of man let us consider, without fear of dissent, some plain statements of fact that certainly do aid and abet the popularity of certain meat breeds.

For years the Dark Cornish was touted as the "ideal market fowl." So far as flesh quantity is concerned, it is without an equal. But at the present time flesh quantity is its only market asset. Its market appearance is marred by a dark slate under color which leaves black pigment in the skin when the young stock are dressed as broilers, and the same applies to fowls during molt, when they are growing new plumage, a fact which is "taboo" among consumers. As to its flesh quality, the following tells the story and is the "handwriting on the wall" for all Cornish breeders to consider for the regeneration of their breed:

The breeding of Dark Cornish, through the fancier, has degenerated into a fadism where fancy points have subordinated market worth to the back-ground. Many specimens today appear more like feathered (Continued on page 950)

The difference in carcass between a sharp-breasted egg type and a full-breasted Orpington.

Putting the Birds in Show Condition

POULTRY like all other live stock should be properly "fitted" before being exhibited. The horseman has his horse thoroughly trained to stand or to "move" as desired. He has removed all the rough hair and has so fed and groomed him that his coat glistens like silk. So with the cattleman; his animal has been properly halter-broken, her horns polished, her tail clipped so as to appear fine, leading to a good full switch. The shepherd has trimmed and clipped his sheep so that the weak spots are hidden and the only way the judge can discover them is by getting his hands on the animal. Even the gardener has nursed and tended his flowers or vegetables and at the end has selected the specimens to be shown with scrupulous care, fixing and displaying them to the best advantage.

If a bird is worth showing it is worth showing well. When a bird is exhibited that has first been properly "fitted" the prize is half won. A good bird "well fitted" will win over an inferior bird "well fitted," and it often happens that an ordinary specimen "well fitted" will defeat a much better specimen that is not in condition, although this is not always the case at the hands of a really keen judge. It behooves every poultryman nevertheless, to properly fit his birds before showing them or to keep them at home.

When to Start Conditioning

The time to think of getting ready for a show is not the day or the week before. Lay your plans months ahead. If you intend to show a "string" at a fall show you should arrange ahead as far as possible to have your old birds in full plumage at the time of the show. To do this it is advisable not to depend on a natural molt. If you want to show three hens, select half a dozen and molt them; then you can decide at show time which to take.

As soon as the breeding season is over take the birds you have decided to molt and put them on a pasture—a good clover sod is the ideal place. Supply them with water, but give them nothing to eat except the green feed they pick up, for about two weeks depending on the condition of the birds; then put them on to full feed, giving them lots of wet mash in which there is a liberal supply of linseed meal. Do not feed too heavily for the first few days as the birds will be ravenous and if given all they will eat are liable to digestive disorders. By the time they are on full feed for a week they will generally be in full molt.

About six weeks to a month before the show, go over the birds and examine the main tail and wing feathers. If any of them are broken or show foreign color, pull them. They will be grown in again by show time. In a solid colored bird, other than white, never pull a feather unless it is "ripe" as it will almost certainly come in with a white tip. To ripen a feather, cut it up an inch or two above the skin, and after the quill dies, pull out the stub.

With old birds that have been shown before not much training will be necessary, but with the young birds considerable time may be required to get them coop-broken and to train them to pose instead of trying to fly out of the top of the coop when the judging stick is used on them. This matter of temperament depends somewhat on the natural, inherited disposition of your stock, and somewhat on whether or not you have grown the birds tame without them ever having been scared.

The best time to start the training is at night after the birds have gone to roost. Take a bird gently off the perch and place it on a box or table. If it struggles to get away, talk to it coaxingly and hold it until it quiets down, then give it a little tit-bit such as a piece of meat or a piece of bread soaked in milk. Stroke it on the wattles with the finger, rewarding it every time it submits. It is really surprising how quickly you can make friends with a bird when it realizes

By M. E. Underwood

Getting new plumage on cocks and hens—Rub on the gloss—Training a bird to stand in the coop—Washing white plumage.

that you do not intend to hurt it. Do this for several nights and as it gains confidence in you begin to pose it until you have it trained to take any position you want, always rewarding it with a tit-bit when it does well.

Do not put a bird up in a coop and keep it there day after day; it is unnecessary and the bird is liable to "go stale."

If you put it up for a day or two, then change by throwing it down in the pen and give it a day's run. In this way it is likely to keep in far better condition than when cooped continuously.

Removing Undesirable Feathers

It is a comparatively simple proposition preparing colored birds for the show as they commonly do not require washing. If they are very dirty all that is required at most is to sponge them off, and even this is seldom necessary. Put them in a pen of deep, clean straw and they will generally clean themselves. However, it is necessary to go over them and remove all the dead and off-colored feathers and groom them to bring the lustre to the plumage. For this purpose nothing is better than the bare hand or a silk handkerchief. Do not rub hard, but lightly, stroking the lay of the plumage.

In "plucking" it will depend altogether on what variety you are handling just what feathers you should remove. In buff varieties all that is necessary is to remove those feathers that show dead or faded tips so as to leave the surface one even shade throughout. In laced varieties it is common practice to remove all "mossy" feathers, but a lot of good feathers are often plucked to open up the surface and give the contrast of color so much desired. In Barred Rocks all black feathers should be removed and also those feathers that show zig-zag or irregular barring.

It is with white varieties that require washing where the big job comes in. Washing is a simple job when you know how, but it requires considerable practice before proficiency is attained. Most people use three tubs. I always use four, the extra tub containing additional clear water for rinsing to make sure that all soap was removed from the plumage.

I always like a good room to work in where I can strip off surplus clothes. Take the four tubs and place them on benches so that there will be as little stopping as possible. In the first tub put water as hot as the hand can comfortably bear. This is the tub where the washing is done. In the second, clear tepid water. In the third, clear cold water—these are the rinsing tubs—and in the fourth, blueing water. The amount of blue to use will depend on whether your birds are creamy or not and how near show time it is. For creamy birds it is advisable to wash them about three times at intervals of a week apart in which case in the first wash the blueing is made much stronger than it would be in the final wash.

Washing White Birds

The bird to be washed is taken and the rough dirt washed from his legs and feet in a pail of warm water, a stiff hand brush being used for the purpose. The bird is then placed in the first tub and thoroughly soaped, starting at the head and taking it section by section. After the plumage has become thoroughly soaped the bird is lifted out of the tub and placed on a board which is laid across the top of the tub and each section is carefully gone over and thoroughly washed. Its legs and feet are scrubbed with the brush and any scales under which dirt is lodged are loosened with a nail pick and then scrubbed until not a trace of dirt remains. The bird is then put back into the tub and rinsed and when the surplus water has been squeezed out of the plumage the bird is put into the next tub, which is clear rinsing water and the plumage is again gone over carefully to get all the soap out. After squeezing out the surplus water the bird goes into the third tub when the process is repeated so that when through with this tub there should be no chance of any soap remaining in the plumage.

(Continued on page 948)

The Real Value in the Work of Trapnesting

TO TRAP or not to trap, that is the question which is puzzling the brains of more poultry keepers at the present moment than any previous time in the history of the poultry industry. "Trap-nested" is more or less of a magic word to a large share of the members of the poultry fraternity and most breeders recognize that their stock would be in greater demand if they could advertise actual trapnest records. While trapnest records are much to be desired, the great amount of time, labor and patience necessary to secure definite trapnest records over any reasonable period are so exacting that poultrymen may well pause and seriously ponder the question of whether or not they ought to undertake trapnesting with their own flocks.

A full year's record is the standard now demanded, and to secure such records with the trapnest means a 365 day job with no vacation and no days off for the person who undertakes it.

Trapnesting means little, except the pleasure derived from handling the birds and knowing something about their production, unless the work can be carried on for a full year; and no special benefit will result from trapnesting unless the year's record can be used as a basis for future breeding work.

It is unfortunately true that a very large per cent of the energy that has gone into trapnesting work in the past has been lost due to the fact that the people undertaking it had not planned far enough ahead to overcome the difficulties and have been forced to drop the work before records of significant length have been secured. In many other cases the possible benefits from trapnesting have been lost due to the fact that no intelligent effort has been made to perpetuate the blood lines of the best birds, as indicated by the trapnest records, through scientific pedigree breeding.

Shall I Trapnest This Year?

Every novice who is considering the matter of whether or not he should trapnest his flock ought first of all to answer two questions. The first is, "Can the work be carried on for an entire year?" and second, "Can advantage be taken of the records secured by using them as a basis for pedigree breeding in the future?" If the answer to either of these questions is "No," then the trapnesting project had probably better be dropped.

Since the public demands birds with trapnest records of 200 eggs or better for a twelve months period, there is

little object in trapnesting birds that do not stand a reasonably good chance of making such records, and for this reason the flock owners who do definitely decide to carry forward trapnesting work ought to carefully

By T. S. TOWNSLEY

The traps should be installed and ready by the end of October—The public is insistently demanding records—How to Construct a good trap nest.

select the birds that are put into the trapnested flock so that as little as possible unprofitable trapnesting will need to be done. The chances are indeed slight for hens that have passed through one or more laying seasons without being trapnested, making records that will have commercial value, and for this reason it is not usually advisable to start trap-

nesting with old hens.

It is generally recognized that birds which make high records during a twelve-month period must begin laying early in the fall because they are almost certain to molt during September, October or November of the following year, thus giving only a nine or ten months' record of production unless the year started not later than November 1st. For this reason it is generally agreed among people who have made a success of trapnesting that only early hatched pullets that mature early enough to start laying around November 1st or earlier are worthy of trapnesting.

On account of the molting season cutting in during the late fall months, it is usually necessary to start trapnesting not later than November 1st in order to secure anything like a year's production. For this reason poultry keepers who are planning to start trapnesting for the first time ought to have

all arrangements made so that they can start their records by November 1st at the latest. As a matter of fact many hens will molt before November 1st and the very best chances of securing high yearly records are provided when arrangements are made so that the trapnesting starts at the time the pullet lays her first egg. Where this is done the year may extend from the time the first egg is laid or may be counted as twelve months back from the time the hen goes into the molt, depending upon which method of figuring gives the highest twelve months' record.

What the Trapnest Teaches

There is still room for much study of the methods of choosing pullets which will make the best yearly records before the laying season opens, but enough tests have already been conducted to show that a certain amount of pullet culling can profitably be done and the principal thing for anyone expecting to take up trapnesting is to select only the most promising of the pullets instead of trying to trapnest the entire flock. There is no special object in trapnesting a bird which has a standard disqualification or which is markedly off type or under-sized because the bird would be of little value as a breeder and the record would therefore be worth but little even if the bird should lay a large number of eggs.

It is known that early maturity, good size, vigorousness and feminine characteristics

Editorial

World Beating Records

C. A. Wiltsee, Arizona, sends us a sworn statement which conveys the information that upon oath Mr. Wiltsee deposes and says that:

"He is the owner of a White Leghorn hen, McFarland strain, that laid between April 4, 1921, and April 4, 1922, a total of 358 eggs; that during that time she missed on December 9, 1921; January 11, February 12, March 3, 10, 17, and 21, 1922; that she is two years old and is an ambitious hen with a wonderful appetite; that she has not taken time off from laying to molt since 1920, and as a result her feathers look badly worn; that she has been kept in a portable coop 6x14 feet in size with wheels on one end so that it may be moved around on fresh ground each day; and that the coop is equipped with a trap nest and a roost in one end. Furthermore, that this hen has two full sisters that made a good race with her, but they both stopped to molt last fall, consequently one of them layed only 314 and the other 321 eggs during the year."

Please do not write us asking what kind of oil said dependent useth to keep the ball bearings in his trap-nests from becoming overheated. We have no reason to believe that the gentleman has gone beyond his facts. We do not know that 358 eggs is the limit of fecundity, that is, the limit of the female's power to reproduce rapidly in great numbers. We even like to think that these big records are milestones on the path of progress, but we are not sure.

Another reader, Fletcher S. Scott, Ohio, has made an outstanding record, and writes as follows:

"During the past year I have been very much interested in the development of Black Jersey Giants, and at the present time I have many that weighed seven pounds on the day they were three months of age. I am very proud of these chickens, and they look more like turkeys than ninety day old chickens."

The mail man favors us again with a remarkable report. Walter L. Hutt, Pennsylvania, writes:

"I am in the hatchery business. On the 28th of March, 1922, I had a hatch come off and sold some of the baby chicks (all Barred Rocks) to a Mr. James Hagney of New Jersey. He raised the chicks and on the 16th of July a pullet (that he has called Polly) laid her first egg, making the bird exactly 3 months and 18 days old. This, I believe, to be a record."

Yes, it is a record. This much we can say: A precocious bird of this kind that matures so very young, will fail to attain sufficient size, will lay small eggs, and will probably go into a fall molt and cease laying when eggs are high in price. The experienced poultryman wants his pullets to take sufficient time to mature and have good frames and be fat when they start egg production in October. Such pullets have the substance necessary to enable them to hold up, for a continuous year, as heavy layers of marketable sized eggs.

Remarkable records attract attention, but they are not of great value. For instance, a cockerel of the larger breeds that was hatched May 12th and weighs 6 lbs. October 10th, has made most satisfactory growth. Faster growth may be dangerous.

We do not believe that Mr. Scott, an attorney in Central Ohio, misjudges the weights of his cockerels when he states that many of them weighed 7 lbs. when three months old. We have never happened to own chickens that made such gains, but we once did produce a 9 lb. cockerel in 5½ months by feeding cooked oat-meal and meat, and later bread and cod liver oil.

This much we can say, chickens can be so fully fed with rich feed that their constitutions cannot stand the strain, and they become weak in legs, or liver trouble may ensue. In either case the birds eventually break down.

In securing rapid growth, rugged stock is needed. A flock cannot stand the enfeeblement of several generations of high feeding for forced growth and still produce chickens that will grow like their forebears did.

Old Vander Snickt, who went with us as guide and interpreter through the Malines, Belgium district, before the war, explained how those practical Belgium growers of roasting chickens went to the country to get rugged stock

to reinforce the blood of their own flocks which had been grown fast and pushed to the limit in close confinement. They wanted to do the fast growing and the pushing, but they wanted hard boned, hard muscled, rough foundation stock to work on.

The business of the constructive poultry breeder is to maintain a breeding establishment that will afford a source of supply to enable practical poultry keepers to obtain good stock birds. It is not for those breeding establishments to break records. Let the amateur customers do that. If a man can keep a hen in a coop, feed her as carefully as he would a baby, give her care that it is impossible to bestow upon a flock of many units, and get his fun in a 358 egg yield, let him do so.

But, are the highly fed, highly strung, 300 eggers the right kind of rugged chickens to form foundation stock for the average man working under average conditions, or will they fall decidedly below 300 eggs in his hands? This much we know:

Some years ago a neighbor bought a 40-lb. Holstein cow. He put her in an ordinary barn, fed her plainly and could not get 40 lbs. from her. He was up against the early environment of that cow, a pampered past, and she could not come down to rough conditions and deliver. Experts will say: "That farmer should have provided better conditions." In point of fact, animal husbandry in this world is not based on parlor-barns, but on ordinary conditions.

Summing up the case of interesting records, it must be allowed that, in the last analysis, they are of limited value. For everything that is gained something else is lost. That is the law of compensation.

What we need is well balanced poultry. Of what value is a more than 300 egg hen if she lays a small, miserable egg? The owner of one such hen told us that he did not set any of her eggs this year. He added, "I propose to offer for sale the kind of eggs I set, and I shall, therefore, cease to use the picture of that particular hen in my mating list." Such is the reaction when a practical breeder, no longer stimulated by the powerful incentive of enthusiasm to break records, ceases to evoke those methods that produce a phenomenal increase in the vital action of his fowls.

It is not abnormal, individual records gained at the expense of stamina, but high general flock quality, combined with beauty, breed type and vigor, which constitute true utility.

Meat Values

So much is being said about egg production, egg type and the profits of egg farming, that there is danger of losing sight of the fact that there is something more to a chicken than its power to lay eggs. It is timely that an article on "What Constitutes an Ideal Market Fowl," as contributed by W. H. Card in this issue, should be brought to the attention of poultry keepers.

The production of good table poultry has never been overdone. At the present time, according to the latest report of the U. S. Department of Agriculture, there is a total cold storage holding of frozen poultry of 30,678,000 lbs. This is a slight decrease compared with the five-year average of 31,403,000 lbs. The same report shows the eggs in cold storage warehouses to total 10,225,000 cases, compared to a five-year average of 7,158,000 cases, which is a material increase.

In many sections, the poultry consigned to market is small and of inferior quality. The "Swat the Rooster" campaigns, which have resulted in farm stocks being reproduced from flocks headed by young males, have affected the production of good poultry. The culling campaigns, which have penalized every matronly hen with good flesh-

ing qualities and put the premium on birds with hatchet shaped breasts, have decreased the flesh qualities of many farm flocks.

The wide margin between feed costs and selling prices for eggs have given a tremendous stimulus to feeding, breeding, and culling for egg production. But poultry keepers, in many instances, are awakening to the fact that they are losing something. E. F. Murphy, head of the poultry and egg marketing work of the Illinois Agricultural Association, who is establishing a poultry farm of his own in Central Indiana, recently stated:

"Last spring I purchased some eggs from a good flock of Standard-bred Barred Rocks as bred by an old reliable breeder of this variety in Illinois. I also sent east for some eggs for hatching from a bred-to-lay flock of Barred Rocks.

"The Standardbred birds have grown big and look good. People who have come to my place, without exception, have admired them and have picked on these birds to grade up their flock.

"The egg-bred stock is small, deficient in substance of body, and hasn't the weight on the scales. I do not question but what they will lay a few more eggs, but if I had wanted Leghornized chickens I would have bought Leghorns. What I want is the best egg yield consistent with true Plymouth Rock size and type. A farm chicken that is deficient when it ultimately reaches the butcher's block is not the kind that will maintain the reputation of the Plymouth Rock breed as a popular chicken on corn-belt farms.

"The bred-to-lay stock which I have, numbering over 200, is exceedingly poorly marked, not vigorous and stocky. It seems to me that the more desirable Barred Rock is the Standardbred which is decently marked with a good body conformation. I bought into both strains in order that by careful study of these two types I could determine which seemed the most logical for me to keep, and I have come to the conclusion that the Standardbred Barred Rock which represents, as Plymouth Rocks are intended to, the general purpose fowl, is the one which most nearly fits the needs for which Barred Rocks are intended. I am so confident of the situation that I am sending all the bred-to-lay cockerels to Chicago to the open market and disposing of this class of Barred Rocks."

Mr. Murphy does not speak in the capacity of a backlot poultry keeper. He is building a breeding establishment to supply the best type of stock birds to those whose poultry is linked with the best systems of general farming. As an agriculturalist, he knows that poultry is an industry and that 90 per cent of the products of this vast industry is produced on the farms of the nation. That is the big viewpoint. Just as one may relish a roasting ear of corn, he must not fail to look beyond the sweet corn in his garden and see the three billion bushel corn crop which is being harvested on the farms of the nation, for that is the corn industry.

There are sections that are becoming so highly specialized in egg production that they must import table poultry. Henry C. Turck of California writes:

"People here are fast becoming cognizant of the fact that egg production is not the only paying feature of poultry craft. I am encouraged very much by the demand for 'eaters.' Two carloads of table poultry are the daily average receipts in the Los Angeles market. The stuff comes from Iowa, Missouri, Kansas, etc."

Other comments along this line are becoming more numerous. W. E. D. Stokes, President of the Chesapeake Western Railway, wrote us during the summer:

"When I was a boy, Shanghais were very common in this country. Before modernized into the Cochins, they were by far the largest chickens I have ever seen.

"We have a little experiment station on our railway, at McGaheysville, Virginia, where we have today some cockerels four months old that weigh 6 lbs. What we are breeding is chickens for meat.

"The farmers up our way are the highest grade in the country. But our district is filled with White Leghorns which in a way are very good chickens; but after they are 10 or 12 weeks old they are not much good for meat.

"We are endeavoring to produce large, early developing fowl. We are trying to breed on scientific lines so as to increase the size and produce big broilers and early developing chickens, which will bring more money to our district."

Mr. Stokes is personally interested in chickens and has been for a number of years. He is staging this year, in his railway station at Harrisonburg, Va., November 4th to 6th, 1922, the "First Annual Meat Poultry Show." There will be four cash prizes for pens of birds, consisting of one cockerel and four pullets each, hatched since January 1, 1922. The first prize is \$500; second prize \$250; third prize, \$150; and fourth prize, \$100. Alfred R. Lee, in charge of the poultry work of the U. S. Department of Agriculture, and A. F. Treacle, Professor of Poultry Husbandry, Virginia College of Agriculture, will award the prizes. The birds will be judged on the basis of 75 per cent

for actual weight, and 25 per cent for heavy bone, correct carriage and breeding.

Mr. Stokes will also give two prizes of \$50 each for the best cockerel and pullet; and in a junior judging contest for boys and girls, will send the four best judges on a free trip to the forthcoming Madison Square Garden poultry show.

Why is Mr. Stokes doing this? He is a man who has given considerable study to the breeding of live stock and poultry, and has become convinced that the prosperity of the farmer along his railroad can be very much advanced through the development of better chickens, and believes it especially important at the present time to push the larger breeds.

Some men in the agricultural colleges may say, as they have in the past:

"Let the farmer go on growing poultry meat, if he wants to. He doesn't know what it costs him to produce it, and if he did know the cost, he would find that he was coming out at the little end of the horn."

What are the facts? Rockingham County, Virginia, in which Harrisonburg is the county seat, has 3,600 farms averaging about 100 acres each, which are farmed almost entirely by people who own and live on them. These are farms operated by men who are general farmers, not specialized farmers, and their poultry is one of their farming operations.

The agricultural stations of the states have highly specialized departments in every branch of agriculture. Their poultry work is specialized. It does not dove-tail into other farm operations as on the farm itself. At these college plants the best results, in dollars and cents, are secured when the work is carried on with breeds highly specialized for egg production. Markets, prices and costs have been favorable the past few years to the development of this college attitude toward breeds and methods. What of the future?

DeWitt C. Wing, managing-editor of The Breeder's Gazette, sometimes referred to as "the farmers' greatest paper," has recently written an editorial on dual-purpose poultry which reads in part as follows:

Breeders of poultry and live stock are eager to sell to farmers—to "get the farm trade." Would they not be far more successful than they have been in the past if they would offer farmers breeds that are adapted to farm conditions, and not expect farmers to change their conditions and practices to fit a specialty?

"It is an interesting anomaly that the overwhelming majority of farmers, who are not specialists, should, without special training and experience, be expected to adopt specialized breeds and the teachings of specialists. We suspect that if those who preach specialization the loudest knew more than some of them appear to know about farming and farm conditions as farmers know them, they would modify their 'message,' make more 'converts,' and do more good. It is more important and appropriate that specialists should come down and talk rationally to farmers in the terms of practical farm experience than that all farmers should eagerly fly up, like unreasoning moths, to take their bright teachings and magnetic specialties on faith.

"Specialism has accomplished many invaluable things for agriculture, but specialists and their specialties are running too far ahead of the vast procession of farmers. This accounts for the widening gap between the large body of accumulated facts and the methods of farming commonly practiced."

That is sound counsel from a man who knows beef values as well as dairy values, and moreover, knows agriculture as it is conducted on American farms.

What the farmer needs is poultry that has meat value as well as egg capacity. He has the feed. He grows three billion bushels of corn a year. Mankind in the United States cannot eat that tremendous crop. This nation eats only about one-sixth that much wheat, the "staff of life." The market for corn is to feed it and then sell it as beef, pork and table poultry. The farmer has the feed, and what he wants is potential raw material in the form of young animals to feed out. He wants a breed like the White Plymouth Rock, of which Purdue University, Indiana, gives the following table showing the gains in weight:

Age Weeks	Pullets	Cockerels
10 weeks	2.0	2.34
12 weeks	2.57	3.17
14 weeks	3.07	3.87
16 weeks	3.35	4.29
18 weeks	3.54	4.79
20 weeks	3.72	5.45
22 weeks	4.21	5.81
24 weeks	4.9	6.4

THANKS!

A MILLION TIMES

More Sol-Hot Heaters Sold Last Season Than All Other Heaters Combined

If you could have sat at my desk last Winter and Spring and seen the orders roll in for my 1922 Sol-Hot Equipment—if you could have read the thousands of letters received later from poultry raisers everywhere telling of the satisfaction and splendid success with Sol-Hot, you would then appreciate why I say to poultrymen everywhere—Thanks! A Million Times!

This unprecedented acknowledgment of the genuine merit of Sol-Hot Equipment, on the part of the poultry public, gave me new ambition and inspiration to further improve Sol-Hot and make it meet the needs of the poultry raiser to a more perfect degree if possible.

I therefore am pleased to announce that I have succeeded in adding some new improvements to last seasons Sol-Hot which I feel sure will interest all who have purchased Sol-Hot before as well as new purchasers. These new improvements are briefly covered on the next page—full details are described in our new folder catalog—be sure to send for it—learn all about the new Improved Sol-Hot—the most perfect brooder stove ever offered to poultry raisers.

I Receive Thousands of Letters Like This

Dodson, Mo.

Dear Sirs:

Received my Sol-Hot Brooder all O. K., and have tested it until I am satisfied that there isn't anything on the market that can beat it. It has any hen beat for a mother. Thanks. Have a prospective buyer for you this fall.

BROODER STOVE

The Heater That Is Years Ahead of All Others

The New Improved Sol-Hot is more than a brooder heater—it is practically a brooder stove. It is also made so that it can be attached to any incubator—also in coal burning brooder stoves—a feature that does away with all ashes, soot and smoke.

The New Improved Sol-Hot Canopy brooder is in a class by itself—there is no other on the market like it. It is so simple an eight year old child can operate it—so dependable that all the attention you need give it is to see that it is supplied with oil.

10 Exclusive Advantages

The New Improved Sol-Hot has 10 exclusive advantages not found on any other brooder stove: **First**—Double Oil Chamber; **Second**—Positive Oil Level Adjusting System; **Third**—Just-rite Valve Control; **Fourth**—All Metal Vaporizer; **Fifth**—Bigger Better Burner; **Sixth**—Protecto Stove Drum; **Seventh**—Handy Tilting Canopy; **Eighth**—Leak-proof Litharge Joints; **Ninth**—Asbestos and Mineral Wool Floor Protectors; **Tenth**—Shipped all set up—ready to use.

Write for Free Descriptive Folder

We haven't space in this advertisement to more than mention these features that make the New Improved Sol-Hot the sensation of the poultry world. Write for free folder which tells all about it—describes every feature and explains it clearly. If you raise poultry you can't afford not to learn all about this

New Improved Sol-Hot Brooder Stove that will solve and end your incubator and brooder troubles. Sol-Hot is made in five sizes—also made to replace coal in coal burning brooder stoves. Folder tells all about them—also quotes **new and lower prices** for this season.

Don't fail to mail coupon or send postcard asking for Sol-Hot Folder catalog—it isn't too early to get the facts about this heater—get posted now—then when you are ready to order your brooder for next season you'll know there is **ONE** and only **ONE** to buy and that's the NEW IMPROVED SOL-HOT.

Notice to Dealers and Agents of Poultry Supplies

Before arranging for next season's line write for Sol-Hot Folder Catalog—it's the Heater your customers are going to insist on next season—it will be advertised three times greater than any advertising campaign ever put out on a brooder heater. Better line up with the popular dependable Sol-Hot.

Sold Last Year

Regal Sensation, First Prize at Madison Square Garden, New York, 1921

Regal quality still advances at New York State Fair Syracuse, Sept. 12th, 1922

For the seventeenth time Regal-Dorcas White Wyandottes prove their matchless superiority at America's greatest early exhibition by making a clean sweep of every prize competed for.

Under Charles Nixon of Washington, N. J., they made the phenomenal winning of

Cocks, 1st, 2nd, 3rd, 4th, 5th; Cockerels, 1st, 2nd, 3rd, 4th, 5th; Hens, 1st, 2nd, 3rd, 4th, 5th; Pullets, 1st, 2nd, 3rd, 4th, 5th; Pens (young), 1st, 2nd, 3rd; Pens (old), 1st, 2nd, 3rd.

National W. W. Club specials for best Cock, Hen, Cockerel and Pullet. State Fair Commission Gold Special for best display.

After placing the awards, Judge Nixon's comment was:

"A marvelous string of White Wyandottes; in quality, condition and development fully equal to the keenest winter competition."

These magnificent birds should be seen to be appreciated. Cocks and hens in full feather, cockerels and pullets fully matured, up to weight and absolutely uniform in shape, color and head points.

Not only as exhibition birds, but also as producers Regal Dorcas White Wyandottes have won public approval and no strain of any breed has a stronger following of friends. Thousands of birds of the same breeding as the winners are at your service. Two hundred acres devoted to the one breed.

FREE — Send for illustrated catalogue, telling all about the Regal Dorcas strain.

JOHN S. MARTIN

Box 51 Port Dover, Ont., Can.

Chickens that grow like the above are a table chicken. And since the females lay eggs, they become a dual or two purpose chicken. That makes of them an ideal farmer's chicken.

What we need is not an increase in the number of specialized poultry plants catering to the egg trade, but more breeders of general purpose fowls of the Standard breeds living on good, productive farms. Narrow, intensive specialization has reached a dangerous point, as evidenced in a circular letter recently received, which offers one-acre "farms" in California, stocked with a thousand pullets, or two thousand if you can pay the price, and equipped with a two-room garage. We doubt, and it is right that we should say that we doubt, if there has been a ten-year period in the history of the world, when one acre of ground would support a family with auto, regardless of what agricultural product that acre was cropped with. It is a most precarious business undertaking to carry specialization to anything like its probable limits. Remember that.

Many people who go into poultry are city people who have not had the opportunity to familiarize themselves with the economics of agriculture. Too often they prove to be people who made their money in the city and spent it in the country.

The great bulk of the poultry and eggs in America is produced by farmers living on general farms that are devoted to diversified farming. The great bulk of the poultry kept on these farms is of the general-purpose type. We urge the improvement of that poultry without losing sight of the meat end. This is not a criticism of the Leghorn. That prolific breed holds the vantage ground that it has won by sheer force of its own worth. There is room for all good breeds and one breed may qualify better than another for certain owners working under certain conditions. The purpose of this editorial is merely to remind, by force of repetition, that the poultry industry is not merely an egg business; that there is a very important meat side to the industry which deserves more consideration.

In handling the larger breeds, methods should perhaps be varied to meet the requirements of temperament and disposition. Many of the state experiment stations base their feeding recommendations on trials with Leghorns. In this point of handling the two types of poultry, Alfred R. Lee of the U. S. Department of Agriculture says:

"The best mash for stimulating egg production in hens of the general-purpose breeds, such as the Plymouth Rocks, Orpingtons, and Wyandottes, according to experiments carried on by the United States Department of Agriculture, is one that is not so rich in corn meal and meat scrap as those frequently fed to Leghorns. On the Department's poultry farm at Beltsville, Md., the best results with general-purpose hens were obtained with a mash containing 18 per cent of meat scrap with considerable ground oats and wheat bran. The entire mixture is made up in the proportion of 3 parts of corn meal, 1 part of bran, 1½ parts of meat scrap, 1 part of middlings, 2 parts of ground oats, and 5 per cent of linseed meal. As a result of using this feed the hens produced a good yield of eggs, but did not become overfat and were in good breeding condition.

"Leghorns and other breeds of the same type can use a heavier and more stimulating ration without endangering their physical condition and the hatching quality of the eggs. The mash that has been giving the best results with the Department's Leghorn flock is made up of 4 parts bran, 4 parts middlings, 66 parts corn meal, and 26 parts of meat scrap. Barred Plymouth Rock pullets fed on this heavy mash laid a few more eggs than pullets of the same breed fed on the first mash, but they suffered in health and their eggs were lower in fertility."

Revision of the Constitution of the American Poultry Association

Authority was granted to the President of the American Poultry Association by the Knoxville Convention to appoint a committee of five to revise the Constitution and By-laws

of the organization, said committee to make its report at the next annual meeting of the Association, to be held in Philadelphia in August, 1923.

Thos. F. Rigg, President, is a man of opportunity. It has fallen to him to remake the Standard of Perfection in his first term of office, and now in his second year he is to direct the remaking of the Association itself.

There have been three constitutional revisions within the last fifteen years. The general method of procedure seems to have been to write into the constitution everything that each member on the constitutional committee could think of. The result is a constitution broad enough to take in a billion dollar industry of poultry and eggs, but the only fellows who have come under the tent to live are the purebred breeders.

The only support of the American Poultry Association are the purebred breeders. Mr. Rigg is aware of this. In the platform on which he was elected to the Presidency, he stated:

"I believe that the Association should be given a business administration; that the old organization should be redeemed for the breeders of purebred fowls; that the Standards for these fowls should be given wider distribution; and that the Association should live up to its opportunities in promoting the more general and extensive breeding of our Standard fowls. I stand on this platform."

This is an admirable program condensed in few and well-chosen words. Around it a constitution committee can write a new constitution that will give to the purebred industry the strong, progressive breeders' organization that is needed.

The A. P. A. was organized in the beginning for the Standardbred bird. Its main business for half a century has been the making of the Standard of Perfection. As J. H. Drevendstedt once said: "The Standard is the A. P. A."

The committee on Constitution should remember that. Its first consideration should be the Standard.

At present a new Standard committee is elected by the Board of Directors each year. Politics plays a big figure. When revision time comes around, the directors usually add a few extra men to the Standard Committee and call it a Revision Board. It is like recruiting a "scrub" baseball team. Good players are picked naturally. But let us consider the possibilities of an organized professional team.

Friends, a man like A. O. Schilling should be appointed to the revision board for a period of not less than nine years. Make it a lifetime study of twenty-seven years if you wish. He should gather feathers, talk with breeders, study breeds and variety characteristics, with ever in mind the fact that he was to serve on the next Standard revision.

There should be a permanent committee of three to five men of the calibre of Mr. Schilling, men with a studious turn of mind, men who have the opportunity to annually get into the best shows and talk with the best breeders. It should be their job to prepare, to post up, to be in training for the job of revising the Standard.

What a wonderful book eight years of preparation would produce! The purebred industry in this country has reached the point where it demands that kind of preparation.

The constitution committee should provide for this kind of Standard making, that we may verify and improve what is within the Standard and scrutinize and investigate that which is without the covers of that truly valuable and most important book.

The next thing on their program of constitutional revision should be to "redeem the old organization for the breeders of purebred fowls." If it had not been for the report of the Standard Revision Committee the average breeder at Knoxville would have had few matters and those unimportant, in which to participate. The Board of Directors is practically the American Poultry Association as far as executive power goes.

This condition was illustrated in the attendance at Knoxville. One of the most important meetings ever held, it drew from the New England states, those six great states that rocked the cradle of purebred poultry in America, that staged the first poultry show ever held on this hemisphere, that gave to the

world, the Plymouth Rock, Wyandotte and Rhode Island breeds—only one member.

M. F. Delano of Massachusetts was the sole representative of New England at Knoxville. Frank DeLancey was the only member in attendance from Pennsylvania.

Messrs. Delano and DeLancey, as members of the Board of Directors, had their expenses paid.

Looking at the names recorded on the roll call, it appears that if the Standard had not been up for revision, John S. Martin, director, would probably have been the only Canadian in attendance. In other words, the importance of the average breeder has been diminished to the point where he has little incentive to attend.

"Redeem the old organization for the breeders themselves," should be the slogan. The present Constitution was largely written, it appears, not only to provide, but to make all necessary arrangements to assure organizations from the top down. Section 36, article 6, provides:

"The Association shall pay the railroad fares of the President, Vice-President, Secretary, Treasurer and the elective members of the Board of Directors to all properly called meetings, and for attendance at such meetings shall allow these officers \$5.00 per day for other expenses while on service."

At Knoxville the Treasurer paid out about \$1300 to directors, covering their railroad fares and per diem. For the Philadelphia meeting of next year \$1500 is appropriated by the directors for the expenses of the directors. That means that such prominent breeders as Messrs. Delano and Martin, who, as elected members of the Executive Board, are victims of the system now in vogue, are to have their expenses paid for going to the annual meeting at Philadelphia to attend to their own business. Indeed, the business of the A. P. A. is their business as successful, respected and important breeders.

It is the wrong viewpoint that we have in the A. P. A. The Baby Chick Association charges each of its members \$25 a year dues. In addition, hatcheries are to be assessed \$1 per 1000 eggs incubator capacity, with a maximum assessment of \$200 for a single hatchery. In the A. P. A. most of us paid \$10 for life membership, and we permit the Association to cart us around for the rest of our natural lives.

Redeem the A. P. A. for the breeders. Let the convention transact the business of the purebred industry, not a select group of executive over-lords.

It is clearly evident that in the new constitution it should be provided that the Executive Board should be made up of representatives from the different states and provinces. Let each state send its own delegates.

Transfer out of the hands of the executive committee and intrust back into the hands of the members themselves the real business of the American Poultry Association. It is ridiculous to allow the Board of Directors who have their expenses paid, to decide where the A. P. A. convention will hold its annual meeting. Let the members who pay their way to go to that meeting have a voice in its location.

"Redeem the A. P. A. for the breeders themselves." Get the breeders interested in the only national organization they have. Give those who take the time and go to the expense of attending a convention a big voice in the affairs of the organization.

It will be said: "Some directors are poor men and cannot afford to attend at their own expense." A man who is devoting his time to poultry culture and is such a flat failure that he cannot afford to attend an annual meeting is a mighty poor type of man to represent the industry as a director. Select a man to represent you who is a success, not a penniless failure.

Mr. Riggs' platform promised a business administration. Business does not mean simply financial dealings, buying and selling, or traffic in general. Business also means the affairs and concerns that are of principal interest in life. Business of the A. P. A. does not consist only of selling Standards and show supplies, and thereby making a profit, but it consists also of legislation in the interests of the purebred industry.

Each year resolutions are offered by members at the convention and from time to time

"Viking" Strain Rhode Island Whites

Just Admitted to The Standard

World's Greatest Profit Producers—Read this:

1—They LAY MORE eggs than any other breed of chickens!

Put them side by side with ANY other flock of chickens, such as Leghorns, Anconas, Plymouth Rocks, Reds, Orpingtons, Wyandottes, etc., and the Rhode Island Whites positively will lay MORE eggs than ANY of them. They are, moreover, wonderful Winter Layers, when eggs are highest in price. Rhode Island Whites are making greater average laying records in the leading contests of America than any other breed of poultry.

2—They are as good market chickens as Plymouth Rocks!

About the same weight as Plymouth Rocks, they have rich, golden yellow skin, juicy, tender meat and plenty of it—a real delicacy on the table. They command the very highest prices as Market Fowl.

3—They are beautiful, prize-winning shows birds.

Just picture to yourself, dear reader, flocks of chickens as pure white as the driven snow, with bright red heads, golden yellow beaks and legs, stylish and proud, with nice, full bodies and elegant finish. Ah! they are indeed beauties.

4—They are quick maturing, easily raised.

EASILY CONFINED IN LOW FENCES. IN FACT, HAVE MORE GOOD QUALITIES THAN ANY OTHER CHICKENS THUS FAR PRODUCED! This broad and sweeping statement is proven and backed by every well-kept flock of Rhode Island Whites in the country.

5—Very special introductory prices RIGHT NOW!

In order to introduce these Wonder Chickens as quickly as possible into many different localities, I am giving AMAZING introductory prices on first orders. Remember, THIS IS THE INTERNATIONAL HEADQUARTERS FOR THE BEST R. I. WHITES IN THE WORLD.

Investigate this wonder breed! It will surely repay you! Mail this coupon today!

HOPE, INDIANA

Boyer's Hatchery Thorntown, Indiana

We have for sale 6,000 chicks from 6 to 10 weeks old, mostly White Leghorns, Wyckoff strain.

Owing to the shortage of hard coal we will have no more chicks until November 6th. We will then have White Leghorns, Barred and White Rocks, R. I. Reds, White Wyandottes and Buff Orpingtons. We intend to hatch all winter, and are now taking orders for 1923. Write for prices. We have 100,000 egg capacity.

good resolutions are passed affecting judging, showing, etc. After all the effort of debate and argument and final passage of these resolutions, they are not heard of again. No judge or show secretary ever receives a copy of the minutes of the meeting. As a result, the Association has been fitly dubbed, "A law enacting, non-law enforcing body."

Resolutions, rules and regulations that are passed should not simply go into the archives of the A.P.A. and there remain filed away for safekeeping. They should be printed and sent to members for the purpose of first informing them of the action of the national body, and, second, for the purpose of law enforcement. In short, it is idle folly to file away in a vault the actions of the A. P. A. conventions. Put life and vigor into those actions by means of the printing press and circulation.

If the constitution revision committee, of whomsoever it may consist, is a committee that does its work negligently with the purpose of getting rid of a duty, or, under the circumstances, does its work to its convenience so that it will be conducive to self-interest, the day of renovating reorganization will be hastened rather than longer deferred. A practical program to start the action is:

1. Put an element of permanency into the most important work of the A. P. A., that of Standard building.

2. Let the breeders who attend the meetings of the A. P. A. transact the business of the Association, and stop carting around the country a lot of executive over-lords.

3. Let the members of the A. P. A. decide where they will hold their own meeting, and stop letting the Board of Directors decide where they would like to go on their annual outing at A. P. A. expense.

4. Put into printed form for distribution the rules and regulations adopted by the A. P. A. at its meetings, and not merely file them away in a vault.

Interview With a Poultry Breeder

Riding through the rolling country of Kentucky, en route to Knoxville, we enjoyed the company of Frank F. Conway, who, for a number of years, has been prominent in the ranks of purebred breeders.

Believing readers of these columns would be interested in what a man of Mr. Conway's experience and observations might talk about, we are putting his conversation on paper as the train rolls along.

Says Mr. Conway: "The five most important points to consider in a chicken are type, color, size, constitutional vigor and right breeding. Inasmuch as the Orpington is a big breed, and has a good deal of type, a big sheet of color, and is of huge size, it follows that each of these points is of pretty big dimensions as measured in proportion.

"Let us talk about type first. In sizing up a bird there are two things that I consider. A judge comes along and sizes up the shape of the bird just as he sees it. His opinion is often based on what his observations are—what his first impressions are. But the time is coming when the shape of a bird will be determined more by the actual body shape of his carcass. That means going down underneath the feathers. That is the way live stock judges work. They feel the animal for its actual shape by putting their hands on the back and over the haunches. The A. P. A. at Knoxville this week could do no more progressive thing than to instruct judges to get down under the surface and feel the carcass.

"I want to tell you why I believe that body-shape is to come in for greater consideration by the breeders and judges of this country, not only from a show point of view, but also from the standpoint of the productiveness of the bird. Just yesterday in handling two Buff Orpington hens, one that has been a heavy layer and the other a poor layer, I found an interesting comparison. While both of these hens carried good Orpington type, as viewed in the yard, there was a marked difference in body shape as determined by handling. In looking at these two hens in the yard and observing their similarity of good Orpington type, a man might say that there was no such thing as an 'egg type'; that it was impossible to pick out the good from the poor

Hillview Farm Box 4004 Benld, Ill.

layer by any apparent differences in shape; but when I got the two hens in my hands and felt of their carcasses, I found marked differences in their body shape, as some figures that I tabulated will show:

"Both hens measured 4½ inches across the hips, from hip bone across back to other hip bone. The good hen carried the width well back from hips to stern and at the narrowest point, which is just in front of tail, measured 3½ inches wide. The poor layer, however, pinched in and had a width of stern ¾ inch less, being 2¾ inches wide just in front of tail. In other words, the poor layer, while having an apparently broad back, really was narrow and pinched in from hips to stern when her carcass was felt.

"In drawing my rule from a point between hips and the tail, straight down to the end of the keel bone, I again found a difference of ¾ inch to the good layer's advantage. She had the deeper body, measuring 5½ inches, as against the more shallow depth of 4¾ inches in the poor layer. You see, the good hen had a bigger barrel, which was only found when I actually handled the bird; for, mind you, these two hens looked very much alike in outward appearances.

"This aroused my interest to the point of going further with these measurements. Taking up my rule, I started on the front of the bird. I had found that the rear end of the hen I knew to be a good layer was bigger, broader and fuller. I did not find these same differences on the front end. Across the shoulders both hens measured 6½ inches. From shoulder to keel bone, the heart girth, as a live stock man would say, measured the same, 5½ inches. The breast bone, or keel bone, was of equal length, 6 inches, in both hens.

"These two hens are what I consider two of my good Buff Orpington females. The one I have referred to as the good layer is compact in body, with no excessive feathering. She is practically ideal in type, showing a broad cushion, broad shoulders and good full front. The poorer layer appears to have equally excellent type; in fact, looks the larger of the two. She has good outlines, as observed by looking at her, but as you have often said, the outline of a bird is largely dependent upon plumage development. Upon handling, I found her carcass fell short; she was narrower across stern, not carrying her width from hips well back to tail, which is necessary to those rather straight sides of body that are characteristic of the good layer. Nor did she have the same depth from hip bones to end of keel bone back of legs. Her deficiency of carcass was made up by a greater wealth of plumage, altho she did not show Cochin type; yet her actual body shape was deficient as measured by the newer standards of productive value.

"This goes to show that high-productive birds can be, and are, produced from standard typed stock, without losing any breed characteristic of the race. You can alter the type of breeding feathering; you can get a longer tail, for instance, by breeding larger feathers. But, I believe that henceforth more fundamental alterations will be made by breeding body type in conjunction with typical shape. Feathering has no bearing on productiveness of a bird, but body type has.

"Of course, outline type is important. It is what you see first. It is the magnificent profile and outline that the chicken within shows off to the world. The surface should never drop in importance. All the beauty of design is not within. Nature presents to the eye of man pleasing outward forms in plant and bird life. We must not underestimate what we see—the outside. The fancier should never become a mere chicken grabber—afraid to admire a bird until he gets his hands on it. The bird to be worth coop room and feed must first fill the eye.

"We are getting productiveness from birds that possess standard outlines. Let us preserve all that we now have and then go as much deeper as we can. I am not one for altering the typical shape of the breed. A man spends years breeding good type, and getting it, and along comes an agitation organized by mediocre breeders who want the type made to fit their birds. To follow those false leaders would take much of the credit away from the man who has been a

student of the standard ideals. All changes should be made gradually. If made quickly you see all kinds of types, for breeding tendencies cannot be made overnight.

"In sizing up an Orpington, the first thing is looking at the bird forward. There must be broad shoulders, with the width carried straight through. The back must not pinch in in front of tail. The tail must be broad enough to carry the width of shoulders and saddle clear to the end. A narrow tail, stuck in like a fan, may be due to the shape of the so-called 'parson's nose,' out of which the main tail feathers grow. Some of these rear protuberances—I don't know what the anatomical name is—are narrow. Did you ever feel them? They vary considerably in shape, not only in the breadth, but in carriage. I can tell a cockerel when he is coming along, whether he is going to be high in tail, or carry his tail wry, that is, to one side. In a high-tailed bird the rear protuberance, oil sack and all, stick nearly straight up. Did you know that Arthur Schilling, in picking some of his foundation stock of White Leghorns, examined this 'parson's nose' quite thoroughly. Tail helps to make a Leghorn; and he examined the caudal vertebrae, which constitutes the bones to the tail, as it is covered with flesh, quite thoroughly. I was a silent observer of this at the Chicago show, when he was handling a Leghorn male. Then I asked Schilling about it. Judges need not be fooled by steamed down tails if they will do a little handling of this end piece. In fact, we must learn to do more handling, knowing, of course, what we are looking for.

"Now the Orpington, which I started in to describe, is still facing us. He is broad from shoulders all the way back, with broad saddle, and properly built tail necessary to carry out the width. The front of the bird must be broad also, and full, and well rounded underneath, coming around without any break at all, and no sagging underneath. To get this full front, the breast bone must not only be long, but carried well forward. This keel bone must run well in front of the legs. Probably you have noticed that the keel bone that is short and that does not extend well forward results in a poor breast, giving a pinched-in appearance. You never can breed a full-breasted bird from specimens carrying a short breast bone; it is a deficiency of body shape that cannot be overcome by plumage. If you will get the breast bone long enough there will be no need to burden the standard with 'forward tilt.' Observation is a student's best friend, for by observing things thereby you learn. The breeder of today must be a student, take notes and not be afraid to spend five or ten minutes or a half an hour in observing a particular male or female.

"Turn the bird around a bit, so as to get more of a profile view. The soft feathers on the lower body, directly behind the legs, sometimes called the fluff, should be compact and nicely rounded. A lot of these birds with objectionably long fluff have a hairy feather. I want the same webbing found in the lower breast feathers to carry well back into the fluff. If you will get a rather well webbed-out fluff and get away from the hairy character of feather in this section, you will get the compact, nicely rounded appearance that produces the clean-cut type of Orpington now in demand. The old Cochiny bird, with hairy fluff on sides of body, is an illustration of that profusion and excess of body fluff that has no place in the modern Orpington.

"Say, Frank, it's getting hot down here in old Kentucky. I have taken off my coat. Now, I'll have to shed my vest. No wonder the coca-cola people are paying extra dividends.

"By the way, this railroad has a pretty good roadbed—it makes easy going. That is what an Orpington must have—a good foundation. The legs are not the last thing with the comb the first—not by a whole lot. I want good, strong bone in the legs. The shanks should be well rounded, not flat like a Cornish. And, I like to see that pinkness down the sides of the male's shanks, as it denotes strong constitution. An actually white shank, free from pink, does not indicate the same vitality. This isn't an observation of the last two or three years. Years

Help your MOULTERS MOULT

If you want your hens to moult naturally—

If you want them back on the egg job promptly—fall and winter laying—

Then you must make sure that your moulters are healthy and hungry.

They must eat lots, and be able to digest what they eat.

That's just what

Dr. Hess Poultry PAN-A-CE-A

does for your moulting flock.

It's a tonic that begins with the appetite—improves a hen's whole system.

It has Iron that keeps the paleness away, makes the combs and wattles red—the blood rich.

Pan-a-ce-a starts the food the egg way as soon as the moult is over.

No time lost.

No dormant egg organs after the moult, where Pan-a-ce-a is fed.

Tell your dealer how many nens you have. There's a right-size package for every flock.

100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum

For fewer hens, there is a smaller package.

GUARANTEED

DR. HESS & CLARK Ashland, O.

I spent 30 years in perfecting Pan-a-ce-a.

HAROLD TOMPKINS RHODE ISLAND REDS

Grand Exhibition Birds and Breeders

NOW ready for the show room or breeding pen. Each bird possesses that oblong body, Standard black markings and rich, red color that makes them very popular with the judges and exhibitors.

In addition each bird carries not only the blood of many generations of prize winning ancestors but the improvements refined and perfected by the accumulated experience from years of constant effort in producing Rhode Island Reds superior to all others. The results of these efforts have been demonstrated by the ever growing strength of the winnings of this strain in years past and the phenomenal achievement last season at Boston and Madison Square Garden, the leading shows of the world, where twenty blue ribbons were won out of a possible twenty-four and 130 birds won prizes out of my total exhibit of 153.

Customers Vouch for Their Merit

In addition to this great record made by these birds in my hands, thousands have been furnished customers all over the world including those in Africa, Argentine, Denmark, England, Holland and Japan. Many reports are received from these customers from time to time which show the satisfaction and pleasure obtained by buying birds from this strain. Some of these reports are quoted in my Premium List others will be furnished upon request.

Profit by This Opportunity

Due to my great winnings last year my showing this season will be somewhat restricted. This will allow me to give my customers the benefit of birds that ordinarily I would need for my own exhibits. I can furnish show birds both old and young that will please every reliable judge at any show. All birds are exactly as represented and square treatment is guaranteed every customer. Write and let me help you.

NU-LIFE FOR CHICKS

Thousands of winners in last season's shows were aided from shell show-room by NU-LIFE.

NU-LIFE TONIC (Powder Form)

Prevents and cures Bowel trouble in baby chicks, quickly restores stunted chicks back to a healthy growth and is unequalled as a tonic for adult fowls or turkeys.

NU-LIFE PILLS

Endorsed by America's Leading Fanciers as the best remedy on the market for Going Light, Bowel Trouble, Roup, or any run down condition of Poultry, Pigeons or Turkeys.

NU-LIFE Pills and NU-LIFE Tonic are both packed in two sizes, 30c and \$1.00, for sale at your dealer's or sent postpaid at above prices. NU-LIFE REMEDIES must please you. If for any reason you are not satisfied, your money will be refunded. Write for descriptive circular and list of satisfied customers. Agents wanted. Ask for dealer's prices. NU-LIFE COMPANY Box 444-C ZANESVILLE, OHIO

Everlay Leghorns

The Famous EVERLAY Strain of Brown Leghorns hold a World's Record made at the American Egg Contest. Hundreds of enthusiastic customers have found them just what they so much desire, great layers, less feed, so hardy, active and clean on city lot or farm. They have won at all the big shows and will win for you. Just write your needs. Catalog upon request. Bargains in cockerels for show or flock.

H. V. TORMOHLN, BOX 2, PORTLAND, INDIANA

ago when I was breeding Dorkings for Arthur C. Major of England, I found on a number of occasions that those Dorking males showing a certain amount of pinkishness were my strongest breeders and less susceptible to ailments. In England they call for waxy white legs and feet, but our American Standard is more scientific and common sense in expressly stating that pink on sides of shanks shall not be considered a defect. In getting waxy white shanks the Dorking was hurt to a great extent. Fertility ran around 35 per cent and the chickens were difficult to raise.

"The Orpington leg has two parts, when it comes to the important matter of station, of height of body above the ground. The shank of a good cock should be no less than 4½ inches long from hock joint to ground. I don't want too short legged a bird. His drumstick should be about 5 inches long, and no more. When it comes to covering up the legs with feathering, it should just extend and cover the hock joint only, so that when you view the bird from the front you can see clear daylight underneath. And, mind you, you must look through a pair of wide-set legs.

"The breast-bone wants to be long enough so that the shanks will appear to come out just a little back of the center. The underline of the bird needs to be horizontal, which with the breast bone carried well forward, gives the bird that forward tilt that the White Orpington Club wants included in the Standard. What really is wanted is good length of keel bone, and when the standard makers get around to describing body shape as well as typical shape, the proper kind of keel bone can be defined, but it is only a superficial addition to ask for a forward tilt, ignoring the basic thing on which the proper breast shape depends. If the breast bone is short, the bird will be shy in breast and appear to be higher in station. At least, these have been my observations in breeding Orpingtons for a number of years past, going back to a boy of nine years of age.

"I remember when Billy Cook, Sr., originator of the Orpington, drove a higgler's cart, collecting eggs in Kent, England, and after the Orpington breed got to going his sons walked into the Palace show, London, wearing stove-pipe hats, carrying canes, with kid gloves on and patent leather shoes. Today the average man with \$10 or \$15 to spend can get a better Orpington than the originator himself had in those days. No doubt about it.

"Some of those early birds had side sprigs and stubs and you saw all shades of colors. William Cook really employed one of the most popular breeds of utility poultry in England to make his Buff Orpingtons—the Lincolnshire Buffs, bred as a utility chicken by farmers in Lincolnshire. That old stock had more or less feathers on its shanks, and stubs have been a stubborn thing for Orpington men to overcome. It is a defect that is pretty well cleared out now. In color, vast advances have also been made.

"Especially during the last ten years has improvement in buff color been made. The color has been revolutionized and of all the world American breeders have made by far, very far, the greatest improvement.

"In taking up the color question I want to show you some feathers I plucked out of a grandson of the first cock at Chicago, 1913, which was first in the pen for me at New York the month following, January, 1914. That old cock of 1913 I bred from a cock I imported from William Bell, England. The grandson that I have these feathers from was an especially vigorous bird for me this year, although he is a four-year-old.

"Look at this hackle feather. It is 7½ inches long and the width at the broadest point is 1¼ inches. There is a difference in the way a feather is measured. I measure the width by spreading the barbs out as far as they will go. I think you measure the width by laying the rule on the feather. I mention this so that the measurements may be understood.

"The tail coverts are 1¾ wide by 6 inches long. There is an abundance of these tail coverts in this male, which counteracts that break at the base of the tail, where so many birds fall down, and it also provided a mag-

Single or Double Deck Candees for the Commercial Hatcheries

CANDEE superior double decked incubators exactly meet the requirements of the commercial hatchery:

Labor Saving—One master lever in two seconds turns all of the eggs needing turning on one side of a deck as there are two master levers for each deck, in eight seconds all of the eggs can be turned in 20,400 capacity.

Cooled Nature's Way—By opening the doors of the 300-egg compartments and allowing the growing embryo to cool down the same as when Mother Hen leaves the nest. In the Candee, eggs needing cooling can be cooled by leaving the doors open without overheating the other compartments where the doors remain closed, because the main heat supply is outside the egg chamber. This is an exclusive Candee feature.

At all times there is a steady supply of fresh air entering each compartment through the ventilation openings in the bottom, bearing ample oxygen. Most poultrymen contend that it is necessary, besides, once or twice a day, from the fourth or fifth day to the eighteenth day to allow the eggs to cool off, and as a result they get stronger, healthier chicks. In the Candee this can be done in the simplest way—namely to leave the doors open and not have to take the eggs out of the machine.

No mixing of chicks—Each tray is separated by a wire partition and each nursery underneath the tray is partitioned off so that there can be no mixing of chicks. Each setting and each hatch cannot become mixed. The trays are convenient size for the average number of eggs brought in for custom hatching. Whenever a total of four trays is ready, a compartment can be started. Then the temperature can be run at the exact degree of heat needed for each week of incubation.

Each deck complete—Each is a separate hatching machine and is operated independently. Each deck has its own heater and automatic regulator which insures the greatest economy of fuel, as no more coal is burned than is actually needed to maintain the compartment temperature. Either deck can be started and only one heater used until the supply of eggs becomes large enough to start the other deck. This eliminates waste and saves coal. It also spells safety.

It is unnecessary to transfer eggs from one deck to the other, as both are complete hatching units.

Shipped All-Built—Candee sections contain two 300-egg compartments and are completed at our factory, crated and reach the customer all ready to set on the legs and to couple together. The heating pipes are in place and installation is only a matter of a short time. No expert labor or factory representative is required as any handy man can do the work. This is a large saving in cost.

In the season, when customers find that they have a larger business booked than they can handle they can get extra sections and increase their hatching capacity without delay.

How CANDEE Customers Succeed—

Read how Earl Haner has developed his business, starting with an 1800-egg Candee seven years ago:

Silver Spring Hatchery, Abingdon, Ill., Aug. 13, 1922.

Seven years ago we started with a 1800-egg Candee. Ran it one season and saw what possibilities there were in the baby chick business, so bought five more sections, making us 4800 capacity. Ran this machine four seasons, then moved to our present location where we have purchased a forty-acre farm devoted to poultry.

Then we bought twelve sections, making us a total of 13,200 egg capacity double deck Candee. Have built up a good trade by square dealing and have shipped chicks to twenty states with very few losses. Right now, we are getting more orders than we can handle. The demand for chicks that are hatched right, we find is ever increasing and Candee chicks are hatched right.

Yours for more and better poultry,

EARL HANER, Prop.

P. S. Have shipped over 50,000 chicks this season.

CANDEE INCUBATOR & BROODER CO.

Incubators, Brooding Systems and Colony Brooders

Department 2

Eastwood, New York

From a photograph of a Candee double deck 20,400 egg capacity. Equipped with Automatic Egg Turner, and with it all the eggs needing turning can be turned in eight seconds time. Cooling of the eggs is done by opening the doors. The only time the eggs are handled is in testing out the infertiles. The top of the upper deck is only 5 feet, 11 inches from the cellar floor.

CANDEE COLONY BROODER

Broods up to 500 chicks in one flock in one building, with only one heater and one coal fire to attend. Big and quick heating. Its coal magazine, big fire bowl and large 12-inch grate keep the fire burning over night and all the time.

Money-Back Guarantee

You know what an incubator and brooder should do. You can write your own money-back guarantee on your order for Candee equipment.

Broods up to 500 Chicks

Kills every Rat New Super-Virus!

Make Your Own Super-Virus At Home—Easy—Here's How.

There is now no need for paying \$1.00 an ounce or more for ready made rat virus, most of which may be salt water, agar or simple bouillon.

A new method of culturing and shipping now provides the genuine, live Dany's Organisms unmixmed with anything else. They stand shipping in any weather, and are effective until

used, up to 6 months. These organisms—germs—are harmless to handle. They affect only rats and other rodents, giving them a fatal disease that quickly wipes them out, young and old. The Dany's Organisms are simply put into cool, sweet milk and then put on dry bread, oatmeal or other suitable bait.

Rats greedily devour bait so prepared. In a few days rats spread the Dany's Organisms, exposing other rats to the same disease. The same for mice and gophers. Yet it is harmless to people, to poultry and all animals except rodents.

A bottle containing 2,000 billions of Dany's Organisms, costs only \$1.00 and makes 16 ounces of super-strength virus—16 times cheaper than other forms of rat virus; and 10 to 20 times more rat killing effectiveness per ounce, because of the greater virulence (deadliness) of the organisms, and the greater number of billions of organisms per ounce. Prepared at home, fresh, as used, this virus is therefore of the highest potency.

Send \$1.00 to the Hunter Laboratories, Dept. 128, Kansas City, Mo., or order C. O. D. for \$1.00 and postage. Use the Dany's Organisms according to directions on bottle, and if not satisfied after three weeks, get back the dollar promptly. The experience of thousands of users proves this method best for rat destruction.—Advertisement.

CHAS. KIRCHNER
304 S. 6th St., Marshall, Ill.

nificent ground for color. It is important that these tail coverts should be rich, golden buff, not bronzy nor mealy. Never breed a male that is mealy or has a streaked appearance on tail coverts, for it will beget washiness on the wing bows of his pullets. This is a defect very hard to get rid of once it is introduced into a line or strain of birds. I really think that mealiness on wing bows of pullets should be cut harder than at present. Such pullets fail in color as hens.

"I never allow that mealiness to come in, for I select against it with great care. The result is I have a uniform flock of pullets without any streak in them. You will find more of that mealiness in birds darker than rich golden buff than you will in the true golden buff.

"Look at the thickness of the fluff of a body feather from this four-year-old cock that I bred this year. The undercolor is a soft buff; the quill is buff. I attach a whole lot of importance to the color of the quill. I like the buff in the quill to run right down to the skin. No judge deludes himself when he looks at the amount of buff in the quill of the wing primaries. It never runs down so well in that section, and for that reason it is a good point to look at.

"Weakness of color at the base of the male's neck is a common defect. You will notice that the feathers from the hackle of the cock have a web that runs very deep down in. The fluffy portion is relatively short. This appears to result in an especially sound undercolor of neck hackle.

"There is one thing that must be done. We have the buff color that is right, neither too dark nor too light. Our job now is to establish that color and maintain it so that a bird will be buff not for one year only, but until the bird dies, so to speak.

"For several years I have been working along that line, i. e., to stabilize buff color. Here are some feathers from a four-year-old hen that hasn't been shaded, but has run out all season. See how she has held that color. The feathers look like pullet plumage, but they are old feathers. See, there is no sap in them. Now, there is only one way to establish this buff color, and that is to breed from hens that are from two to four years of age. A pullet may be the finest color you ever saw, but as a breeding proposition you should prefer a hen that has molted through. Hens and cocks also give you the best type, producing more massive chickens, and they give the chickens with the strongest constitutions that attain the best size.

"The average buyer wants a lot for his money. Almost any breeder can furnish 'a lot,' but the beginner would be better off to put his money into quality instead of quantity. I have paid as much as \$250 for an old cock in my time. A good old cock and a tested old hen are worth a lot to any new breeder. There has been a time when it appeared to me that I should have some certain birds, and I have paid \$175 for two hens, not for showing, but just for breeding and bringing out certain points I wished to get. I mention this to illustrate how important it is for the average breeder to make his investment as already suggested.

"I don't like a dull-colored buff, and must have sheen, because that is the life of the color. You will find that such feathers will hold up better in color and are not so subject to weather wear as a dull buff feather, which loses its color and goes to pieces in no time.

"You can get good cockerels and good pullets in Buff Orpingtons from a single mating. You can do it. But you will get more good cockerels from a cockerel mating and more good pullets from a pullet mating. For a pullet mating, use a male whose breast feathers are of exhibition female color, the color of the breast running well into the feathers of lower body. I don't mind a little golden lacing in these body feathers, for that denotes richness or strength of color. The feathers on the wing bows and over the shoulder are of importance in a pullet breeder. They must be a soft buff, free from shaftiness or speckled mealy appearance. Those broad tails coverts must be of soft golden buff. The neck of the male can be a little light at the base, and the surface of the

This SAMPLE Makes 2 GALLONS Dip and Disinfectant

We want you to try this new and better Coal Tar Disinfectant—the only one made in solid form—

Conkey's NOX Solidified Disinfectant

Just dissolve one little cube of Conkey's Nox in a gallon of warm water and you have a gallon of Disinfecting Solution all ready for use. You pay nothing for bottles, barrels or cans; pay no freight on heavy liquid; you have no leaking or breaking.

Destroys Lice, Mites, Ticks

In combating poultry mites and similar uses, Conkey's Nox is undoubtedly the most efficient coal tar preparation known to science at the present time. It should be used constantly for cleansing and disinfecting coops, nests, roosts, incubators, brooders, fountains, etc.

Use Conkey's Nox once and you will prefer it to any other form of Disinfectant, Extremator or Germicide. Send 10c. coin or stamps, for sample package containing 2 cubes, for making 2 gallons. Circular free.

hackle and saddle may be on the light order, with a soft, not heavy, buff quill or shaft in the center of those feathers. The under color of the feathers on the sides of the male's body (buff feathers) must be deep and rich. The secondaries must be a soft, level buff. Mate such a male to your best exhibition colored hens.

"For the cockerel mating use an exhibition colored male, the best you have. The females you put with him should have neck hackles that are positively sound, deep and rich in under color and with a surface color that match the neck of the best exhibition males. These neck feathers should not be narrow and small. I like a little lacing in the back feathers of these females; not conspicuous lacing, but a tendency to glossy golden buff edging. It is important that these females should be big and well developed in all sections. I like them to be square across the shoulders. That conformation shows power behind and you get full breasts only on those birds that have these strong shoulders. You cannot breed massive cockerels with full fronts from narrow shouldered, round shouldered females. Any amount of feeding will not assist cockerels in developing the large size, strong bone and massive type if these qualities do not exist in the parent stock. The average breeder is always too short of good she stock, that is, big, strong, matronly females. But, I must say that good breeders will not let such stock go unless a good fair price is paid. They are worth money.

"I like the tail of these females to be practically sound, but more on a darker shade of buff than an exhibition female. Buff has a tendency to work lighter and breed lighter and each breeding season you have to maintain that color; and this little point of darker shade of buff in the female's tail that I mention is a way to control the color, or feed color, whatever you call it. Of course, the wing primaries and secondaries must be sound.

"There is one thing more in a cockerel-breeding female, and that is width of hackle feather. A narrow, stringy feathered male is out of the running nowadays. Poultry breeders are putting more study into their birds than they ever did, and have accomplished more in the last ten years than was achieved in a generation prior to this decade. It must be so; competition is keener, and only the studios, conscientious breeder can today reach the top. If the ordinary breeder hasn't realized this, he should do so now, and without delay.

"The breeder who is capable of building for the future must have an eye for the vitality of a chicken. He must be capable of noting as small a thing as a drooping eyelid, coarse heads, flat heads. Constitutional vigor includes a good deal of type. If you haven't good vitality in your stock you can run into many weaknesses of shape, such as roached backs, twisted wings, wry tails, shallow breasts, long heads, long weak legs. Strong bone, breadth of back, full breast, bright eye, firm step can only be secured by breeding from vigorous stock carrying none of the constitutional defects. "As a last word let me mention right breeding. Do not value too highly a bird produced by a chance mating or unsystematic breeding. The new breeder should get the right kind of blood lines from dependable breeding establishments. If you want to raise good chickens the right kind of stock must be close up in the ancestry."

Green Food

It would be difficult for eastern poultrymen to realize what a dry season western growers have had to contend with this year. After coming through such a dry year, which was topped by the hottest early September that has been known in fifty years, growers appreciate more than ever the value of Swiss chard, rape, cabbage and kale. Green food is an important factor in promoting growth and keeping the cockerels on their legs. With dry, woody grass and weeds, the tender shoots of chard are a luxury. It pays to plant some such green feed, which can always be easily and cheaply grown.

Silver Campines

Green Sheen Strain

I HAVE 400 Campines, 1922 hatch. The oldest pullets are now mature and laying and the cockerels are strong and lusty. Am in an especially strong position to furnish stock for Fall fairs and early Winter shows. Cocks, hens, cockerels, pullets, pairs, trios and pens.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been line-bred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some cockerels now at \$5.00 each.

FRANK E. HERING Desk B SOUTH BEND, IND.

Halbach's White Plymouth Rocks

"The Proven Leaders"

Yes, this line has broken all records. At Chicago, 1920, 1921, 1922; Minnesota State Fair, 1921, and Wisconsin State Fair, 1920 and 1921, they won every prize and ribbon offered. Again at the Wisconsin State Fair, 1922, in strong competition they won every FIRST and every SECOND. Also every ribbon in the Bred-to-lay class, as well as First and Third for best dozen brown eggs. No strain has such a wonderful combination of vigor, egg production and show quality. Are these not the features that you want? Our Fall Sales Sheet, telling about the greatest out and out bargains in true superior quality egg producers is free for the asking. Write us and tell us your wants. We can please you.

CURRENT NOTES AND COMMENT

Judges "Steeped In Crime"

The International Barred Plymouth Rock Journal, in its August issue, refers lightly to the resolution passed by the Judges' Section, reprints the slanderous editorial on poultry judges in bold face type and remarks: "We do not care a whit what resolutions the A. P. A. may pass and we have no apologies to make."

It is now up to J. Harry Wolsieffer, president of the Judges' Section, to report the attitude of Editor Robinson to the president of the American Poultry Association, with recommendations. That organization will not tolerate to see its judges scoffed at and defamed by one of its own members. The A. P. A. raises its judges out of the ranks of its membership, and confers on those judges a certificate of preferment which is a testimonial as to their character and ability.

There are two acts which the A. P. A. could commit that would be suicidal. One would be to fail to protect the integrity of its standard. The other would be to fail to protect the good name of its judges who administer that standard law.

In the words of H. B. Donovan, editor of the Canadian Poultry Review: "We are not going to say any more about it except to express the opinion that it is up to the A. P. A. to protect its judges, if they are honest and to see that they are penalized if they are proved to be dishonest. What we want is proof. PROOF in big letters."

* * *

Mainly About People

Frank W. DeLancey, Pennsylvania, announces his candidacy for President of the American Poultry Association.

To this announcement may be added that Theo. Hewes is a strong possibility for president and J. H. Drevenstedt is being urged by his many friends as a candidate for vice president.

Messrs. Rigg and Nourse have announced themselves as candidates for president and vice president. Each have been honored with two terms of office.

There will be opposition to a change of officers at this time. The financial report shows a balance in the hands of the treasurer, after the Knoxville meeting of \$822.10. Some \$1,500 must still be paid for art work. That leaves nothing to start the publication of the new Standard. It is time that a lot of old timber in the A. P. A. was cut up for fuel.

International Baby Chick Association will hold its next annual convention at Washington, D. C., first week of August, 1923.

D. E. Hale has been appointed chairman of the committee on judges licenses to relieve E. C. Branch, who is hard at work on the new Standard.

Reliable Poultry Journal has moved its editorial and publication office to Dayton, Ohio, after twenty-nine years of publication in Quincy, Illinois.

George Robertson, Canada, is scheduled to judge the Barred Plymouth Rocks at the forthcoming Chicago Coliseum show. If George insists on the same sturdy type of well finished birds in the big mid-western show that are placed in Canadian shows that receive a government grant, given to encourage the right kind of pure-bred poultry in Canada, he will confer a great and lasting favor on the Barred Rock breed in central U. S.

Charles R. Harker, editor of Pacific Fancier's Monthly, passed away at his home in California, August 4. Mr. Harker was formerly editor of the old Poultry Bulletin, published in New York years ago. With the passing of H. H. Stoddard and Chas. R. Harker we lose the pioneer poultry editors of America.

Ed. L. Hayes, who spent the past year in the work of Organizer for the A. P. A. has, upon the termination of that work, started the publication of a poultry paper at

HOLLYWOOD POULTRY FARM

On September 1st We Close Our 9th Year of Breeding

Hollywood Strain of Bred to Lay and Pay

Single Comb

White Leghorns

Our aim has been to produce a strain of egg layers superior to all others. This we believe we have accomplished. We have thousands of satisfied customers, many of whom have furnished us with testimonials stating the marvelous egg records made by our strain in their hands. Some of these testimonials we have published and some are printed in our catalogue. In all we give the date, name and address of the writer, so that you can easily substantiate the authenticity. To furnish further proof of the egg laying ability of our strain since 1915, we have yearly entered our birds in official Egg Laying Contests in many different parts of the U. S. No other breeder of any one breed has ever approached our records. True some have won one or two contests in dozens of states, up one year and down the next, but ours has been a steady, consistent winning record in all parts of the United States from ocean to ocean, thus showing the high average Egg Laying ability of our strain under many different managements and climatic conditions.

High Flock Egg Averages should be the goal of all poultrymen. Upon their average egg yield depends the amount of profit. The greater the flock yield the greater the profit. Our contest winnings up to Nov. 1, 1921, have been published many times and we will gladly furnish these records for the ask-

ing. Four of the first five winning pens at Second Western Washington Egg Laying Contest were Pure Hollywood Strain. One by our own entry and three by customers. These twenty pullets laid 5,300 eggs, an average of 265 eggs per pullet. A nice average we think. For two consecutive years we have had winning Leghorn pen and best individual at Storrs Conn., Contest. This year we are again leading with practically no chance of being headed. This will make three consecutive years' win and we had best Leghorn pen in 1917-1918 contest. Four wins in last five years. A record to be proud of.

We have eighty-three acres devoted exclusively to Leghorns and we believe we have the largest trap-nested breeding establishment in the world. We have 5,200 pullets that will finish their 365 days' trap-nest records shortly. From these we can supply you choice breeding hens with known egg-laying records. We have on range the finest lot of cockerels ever reared by us. All of them from dams with known trap-nest records and sired by males from parentage of known records.

Try one or more of these cockerels. The pullets you will rear from them the first season will repay you several times the purchase price by increased egg production alone to state nothing of the future breeding value of the pullets.

[We solicit your patronage and if favored with it will surely satisfy you. We are as anxious as our customers can possibly be that our strain makes good in their hands. We know that upon the success of our customers rests our success.]

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use Kilamite. No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

THE END.

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Kilamite vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54 Quincy, Illinois.

I Can Supply You with Winners for Your Show

The grandest flock that I have ever owned is maturing rapidly, and I can select just the bird or birds you will need to retain your supremacy at your show. Let me give you a quotation on just the bird you will need to win, rich in the blood lines of the string that made the sensational sweep at Washington last season.

NEWTON COSH, Box A, Vineland, N.J.

Quality—Bred To Lay S. C. WHITE LEGHORNS EXCLUSIVELY

Whether you want pullets, cockerels or mature stock it will pay you to get our catalog and prices. Elliott Poultry Farm, R. No. 7, Box No. 87, Mansfield, Ohio.

Minneapolis, known as the "Northwestern Poultry Journal."

Theo. Hewes, secretary of the Chicago Coliseum show, is having built a new line of exhibition cages for all Leghorn and Minorca males. These cages will be 30x30x28 inches. This points to the day when Langshan cocks will have coops high enough to enable them to show well, and Dorking cocks will be cooped in cages that are long enough for these elongated birds. At present more Langshans are judged on the floor of the aisles than in their pent-up coops.

* * *

What Breed Is This?

No, it is not a white Minorca. It is a prize White Leghorn at one of the English shows. Perhaps there is Minorca blood in the English White Leghorn; at least there is considerable Minorca type in it. The large comb following the neck, the long pendant wattles, the high shoulders and sloping back, the rather erect tail, all combine to make the bird out of type in America. And, strange to say, the big White Leghorn of England is not in favor with English utilitarians as a good utility bird.

* * *

Distribution

Poultrymen sometimes feel that the system of distribution is too costly, too slow and that breakage is too heavy. They should be thankful. Look at the fruit growers. Seventy-five million dollars worth of fruit has rotted in California. Along the shores of Lake Michigan the peach trees are laden with fruit. Growers, to save their trees from breaking down, shake the branches, and let the fruit rot on the ground. In Chicago, peaches sell for \$1.75 a bushel. On the shores of Michigan farmers will count themselves lucky if they can get the cash to pay their taxes. It is not due to an interruption in train service on account of a strike. Transportation by boat across the lake is available. The system of distribution is at fault. A quarter million undernourished children in Chicago need fruit more than anything else except milk and eggs, yet the vineyards and orchards of Michigan, loaded to overbearing, serve neither owners nor consumers.

* * *

Record Cards

Judges do not take generously to the idea of record cards. No reform is ever accomplished without some inconvenience. Judges who can see the increased interest and bigger entries that will follow when the exhibitor gets something to take home with him, will submit to a little extra work. That exhibitors want a record from the judge on the birds they exhibit is again emphasized in the following communication from A. U. Krause, North Dakota:

"I read with pleasure your editorial entitled, 'Exhibitors Want a Record Card,' and I will say the card Judge Lambert out-

lined was very good. It seems to me that it would give every one a square deal, in a small show and would teach a small breeder what points to correct and overcome in his bird. I always have been strong for the score card and I don't believe anything can change my mind as to its value, because I believe that every breeder should know why he lost out.

"I have refused to show birds because I was up against the proposition of receiving no score card.

"If I have to go with real good birds I like to know why I am beaten, if I can't see it myself.

"We are planning to increase our capacity and our birds from year to year and we do not have to be ashamed of the birds we show. I sure would like to see your plan adopted of giving a record card to every bird in competition. I think that would result in fewer complaints at a show and every one would know what they have and what to overcome in their stock.

"I am going to try to get this plan adopted by our County Association for our next Winter's show. Just wrote this to say that your editorial on the subject is the best item I have ever read. I surely am interested in that item and hope that it will be put into practice."

* * *

Small Feed Consumption in October

At the egg contest conducted by the Connecticut Agricultural College, it has been found that from month to month throughout the year the birds will not eat the same amount of scratch feed. In general a larger amount of scratch feed is consumed from the time the birds are housed until about the middle of May. During the 1920-1921 contest the 270 Rhode Island Reds consumed grain as per the following table:

Month	Scratch Grain	Mash
November	13.3 lbs.	9.6 lbs.
December	13.6 lbs.	9.0 lbs.
January	14.4 lbs.	11.4 lbs.
February	14.8 lbs.	12.0 lbs.
March	12.9 lbs.	12.8 lbs.
April	13.2 lbs.	5.2 lbs.
May	13.0 lbs.	13.7 lbs.
June	11.6 lbs.	13.8 lbs.
July	11.7 lbs.	14.3 lbs.
August	10.3 lbs.	15.2 lbs.
September	10.5 lbs.	12.9 lbs.
October	10.4 lbs.	12.8 lbs.

* * *

Leg Weakness in Ducks

A subscriber writes: "I have 72 White Pekin ducks 12 weeks old and several of them cannot walk. They just crawl from place to place and later they die. Could you tell me the cause of this and what I could do for the lame ducks?"

Roy E. Pardee, successful duck grower of Long Island, answers:

"The trouble is caused entirely by incorrect feeding, which has caused chronic indigestion, followed by paralysis of the legs. There is no remedy which amounts to anything after they have once reached this stage. Prevention is the only way to eliminate it and that is to feed properly, i. e., no whole or cracked grains of any kind until they are at least six months old.

"For ducklings 12 weeks old which are to be fed for market I would suggest the following: Two parts cornmeal to 1 part bran to ½ part flour and 15 per cent high protein beef scrap, thoroughly mixed and moistened to a crumbly form. Feed this three times a day and all they will eat in twenty minutes. If no grass is available, it should be cut in lengths not longer than 3 inches and mixed thoroughly with the above. For birds which are to be kept for breeding purposes the cornmeal should be reduced one-half.

"The best thing for your correspondent to do is to kill them at once and market, as there is a very slight chance of them recovering."

The Molt

Nature would triumph in keeping in repair what age and wear would destroy. Sometimes we hurry nature by depriving the fowls of food for a time and then putting them on

Oat Sprouter \$2⁴⁹

This home made oat sprouter was made in one evening by a fourteen-year-old boy with no tools but saw and hammer. The total cost, including stove for heating, was \$2.49. Thousands of these sprouters have been made at home by poultry keepers and hundreds of letters in my files testify that it is the cheapest to make, the easiest to operate, and the handiest and best sprouter ever built.

To make hens lay abundantly in winter you must feed growing green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

Make Layers Out of Loafers

The Putnam Home-Made Oat Sprouter will supply better and sweeter sprouted oats with less fuss and dirt and work than any other sprouter made. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the stove is \$2. postpaid. Plans for building the Sprouter are packed with every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

You can't afford to be without this oat sprouter, even if you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before spring. Most dealers keep it. If yours does not, send me his name and \$2. and I will send you the stove, postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in ten days and I will refund your \$2. together with the postage for its return. I'll run all the risk.

Burns a Month Without Attention

For Fall and Winter Eggs WATER that's RIGHT

Ice water chills the birds disastrously. Sickly, warm water lowers their vitality and often makes them subject to colds. But as an egg is 74% water, the hen must have plenty of this necessity—at just the right temperature to induce her to drink as freely as in Summer—neither hot nor cold, but "just right," without the harmful chill.

The Norwich Automatic Air-Lock Fountain will do this for you. If it is now your custom to water your birds once a day during the Winter, we guarantee that equipping your plant with this wonderful watering machine will greatly increase your egg production.

Send for booklet.

You Can Get More Eggs

Little Putnam Stove keeps water unfrozen—not hot.

Over 90% of the Egg Is WATER

Give your fowls all the pure *un-chilled* water they can drink, and watch them shell out the eggs. One of my Little Putnam Stoves will keep enough water unfrozen to supply 30 or 40 fowls, even in the coldest weather. This Stove holds 3 pints of oil—requires no attention except a monthly filling, due to my patented burner. It's fireproof and non-explosive—can be operated anywhere. You can run it all winter at a cost of from 20 to 30 cents. You'll get enough more eggs the first month to pay for it.

full feed. That will start the molt. Sometimes we hinder nature by supplying rich food to the hens throughout the Fall. They may then molt in December.

Anything that checks egg production will likewise start the molt at this season. Under natural conditions the egg flow slows down in the late Summer and early Fall and the hens grow a new protection in the form of new plumage before Winter.

Flour of sulphur and linseed meal are often mixed in the mash for mottling hens. They should be dusted with louse powder, the coops cleaned, and, if possible, given a range on pasture.

Hens that are kept laying during October and November may shed their feathers so rapidly in early December that they are all but naked and suffer from the cold. In such instances comfortable quarters must be provided. These late molters are usually the high record layers, getting in a full year of egg production.

* * *

Bank Interested In Poultry

The following letter has been sent by the Bank of Rutledge, Theo. Peacock, cashier, Rutledge, Georgia, to depositors in the community it serves:

"Dear Friend:

"Ordinarily, about all that is expected of a country bank is a cheap calendar around Christmas and a cardboard fan during the Summer; both usually bearing the trite message of 'Safe, Sound and Conservative,' a phrase that has never really meant anything, and was worn out when Columbus discovered America. We have been thinking for a year or more that it was time to cut out this line of stuff and get our people headed toward some new plan of farming that would enable them to recover their losses from trying to raise cotton and get on such a firm basis of diversification that nothing can ever again knock the props from under them. We have been working our utmost along this line because we realize that our prosperity can come only through yours. We want to see values back in lands and in stock, and we know this can never be until we hit out in a new direction.

"This letter will have to do principally with poultry. We have already made a bigger start in poultry raising than any other community in the several surrounding counties. People are beginning to turn to Rutledge for information, advice and leadership in the poultry game, and we want our reputation to extend all over the State. We predict that next Fall it will be impossible to supply the demand for pure-bred stock and eggs. The baby-chick industry of America the past season was many times larger than ever before. This is easy money for the hatcheries and we ought to be getting some of it here. Poultry raising is the biggest agricultural industry in the world and if you don't already know this, it is time for you to begin to look around and see what the world contains besides yourself. Our people here seem to think that the whole of creation is fighting for cotton, when, as a matter of fact, there are two hundred and eighty million folks who don't care if we never raise another lock. They want to wear silk in the Summer and wool in the Winter—same as you and I. None of us would ever wear cotton if we were able to buy something else. Let's get able by RAISING something else.

"So, instead of the calendar and fan, we are sending in a subscription for you to The American Poultry Journal for a period of four months. We want you to read and study every single article in each of the four issues. We don't expect every person to whom these are sent to go into the poultry business, and we know there are many who might not succeed if they did. Maybe you are one of those who would. Think about it any way, and if we can help you in making the decision, please call on us."

A Two-In-One Egg

I have a Light Brahma pullet that lays about every other day a double-yolk egg. Yesterday I brought in one that looked unusually large and when I put it on the scale it weighed just exactly one-fourth of a pound.

This morning when my wife broke it to use, there was the yolk and white that looked perfectly natural, but that wasn't all; there was another egg, with a matured, hard shell on it about the size of an ordinary Bantam's egg.

New Mexico.

CHAS. L. DOYLE.

Angell Says

Albert Angell Jr.

Thousands of poultry raisers have written me since my connection with Rosenbaum Brothers expressing their pleasure and confidence in the Announcement as published in recent issues of the poultry press. In reply to these many messages of well wishes for the success of Vitality Feeds, I want to assure the poultry raisers that my new connection makes it possible for me to serve them to better advantage than ever before.

Rosenbaum Brothers in placing me in absolute charge of their Poultry Department means that I am now enabled to place my signature on each and every bag of feed made under my personal direction, as a guarantee and distinctive mark of QUALITY.

You will also note that on every bag of Vitality Feeds, Rosenbaum Brothers "guarantee Absolute Satisfaction When Fed According to Directions."

I also want to further assure the poultry raisers that Vitality Feeds are the result of my life-long experience in the feeding and management of fowls—old and young—of all breeds and varieties, and that before I would lower the quality I would quit the poultry feed business.

Yours for better fed Poultry.

Oak Dale

LeRoy, Minn., August 30, 1922.

Rosenbaum Brothers,
Makers of Vitality Feeds,
77 Board of Trade,
Chicago, Ill.
Gentlemen:

I am sure it will be of interest to you to learn that since you have secured the services of Albert Angell, Jr., to formulate and watch the quality of Vitality Feeds, we have decided to use nothing but Vitality on Oak Dale Farms hereafter.

We pride ourselves in the ownership of America's finest Strain of Single Comb White Leghorns and naturally we are very particular as to the quality of feeds we use.

It is of vital importance to us not only in starting the young chicks but through the growing period up to the time we finish them off to put into the laying

Says ~

houses to know that they are getting the very best feed possible for their development.

We have at the present time at Oak Dale about 10,000 youngsters of the finest quality I have ever seen which is saying a whole lot as you know I have seen a lot of good leghorns in my time. But never before have I seen such marvelous quality at this time of the year.

Business has been splendid with us during the summer and we are looking for a large trade this fall and are in a position to take care of all orders with Oak Dale quality, which is the best.

Will probably need another car of feed, to consist largely of laying mash, early in November.

Respectfully yours,

Harry M. Lamon

By *Albert Angell, Jr.*

If you have not received a copy of our 1923 Poultry Guide just off the press by all means send in your name today. The book consists of 56 pages and cover, contains besides chapters on every subject of value to the poultry raiser, a monthly egg record and account sheets, with a page for each month on "what to do and what not to do."

With this book "Scientific Poultry Feeding & Management" you will have no difficulty in getting out of your birds all that may be in them in egg production this Fall and Winter without forcing. Simply send for the book, then ask your dealer for Four-O-Clock Scratch Grains and Vitality Egg Mash, feed according to instructions and Rosenbaum Brothers will guarantee satisfactory returns in egg production.

If your dealer does not handle Vitality see what you can do to interest him and we will also see to it that your are supplied.

The Real Value in the Work of Trapnesting

(Continued from page 919)

tics in the pullets are rather definite indications of high egg production, while slow maturity, scrawiness, crow-headedness or any other sign of weakness is likely to indicate a bird that will make a poor laying record. In selecting pullets for trapnesting probably the best procedure is to go into the flock when all are confined and start picking out the outstandingly good pullets. This process should be continued as long as birds remain that in the opinion of the owner are worthy of a place in the trapnested flock. Another way of selecting the pullets is to start by eliminating all pullets that do not look good enough to trapnest and continue until only the very choicest are left. In checking up on the selection it is advisable to study the head and body development of each bird. The birds that are markedly coarse about the head or that show dull sunken eye or a narrow pinched back stand little chance of making high records. The birds that are plump bodied, broad backed and have clean cut feminine heads with bright prominent eyes are likely to make good producers. There is no special object in trapnesting a bird that shows evident signs of poor production, and culling should be constantly practiced on the trapnested flock to eliminate as much unprofitable labor as possible. The birds that are very slow about starting to lay, or those that lay only a few eggs a month, are not likely to prove high record birds and may as well be taken out as soon as these characteristics are discovered. The pullet that lays less than 40 eggs before the first of March has practically no chance of laying 200 eggs for the year and ought to be discarded from the trapnest list, and unless a bird lays more than 100 eggs before June 1st, her chances of making 200 eggs for the year are practically zero.

Since the primary object in trapnesting ought to be to secure data for use in pedigree breeding, it will commonly pay the flock owners to select the pullets which have made the best trapnest records up to the time the breeding season opens and pedigree the chicks hatched from these birds. Of course this will result in some disappointment because some of the pullets that make a fine showing during the first few months of the trapnesting period will not lay enough eggs during the entire year to make their progeny valuable, but enough worth while pedigrees are likely to be available at the end of the year to make the practice of breeding the best trapnested pullets worth while.

About the only

object in trapnesting hens after their first laying year is either to measure long distance laying ability or to furnish a basis for pedigreering their chicks. There is no special object in trapnesting the birds which make a low record the first year during any subsequent year. Where a flock of pullets have been trapnested for twelve months it is entirely practicable to eliminate all except those that have laid more than 200 eggs from the list that are to be trapped during the second laying season.

Since trapnesting is designed to pick out the birds that are to make high records, the flock that is to be trapped ought to be given the very best of care. They should have the most comfortable poultry house and should be given the best range. Many attempts at trapnesting result in disappointment because the birds are poorly housed or so closely confined that they do not have a fair chance at egg production.

The matter of choosing a trapnest is of

Cardington, Ohio, Feb. 24, 1922.
American Scientific Laboratories, Inc.
Gentlemen:—I wish to thank you for your promptness in shipping my order of A. S. L. Avian Mixed Bacterin. I had a severe outbreak of Roup in my chickens, with several birds dying each day. When I received the bacterin I first picked out the worst cases for treatment and am glad to say that it checked the disease at once. The second injection cured them entirely and I would strongly recommend A. S. L. Avian Mixed Bacterin to any poultryman troubled with this terrible disease.
Yours truly, Geo. H. Brown.

The Original

A. S. L. Avian Mixed Bacterin

is produced by the American Scientific Laboratories, Inc., under Veterinary License No. 165, issued by the U. S. Department of Agriculture.

60 doses, \$2; 250 doses, \$5; 500 doses \$7.50; Syringe and Needles, \$1.50 postpaid, with full instructions. Properly stored A. S. L. Bacterin will retain its potency 2 years.

FREE New customers ordering both syringe and bacterin (any size) will be given **FREE** a \$1.00 package of GALLI-CURA the real White Diarrhoea and bowel disease preventive.

A. P. J. Readers, do you know that the United Colorplates are winning out in some of our best shows for my customers, THE BLUE and THE PURPLE. Do you also know that I have here one of the finest Poultry Breeding Establishments in America and that I have for sale 1,000 Cocks, Cockerels, Hens and Pullets, wonderful show birds and grand breeders, and here is the guarantee that goes with them: I positively Guarantee every Bird I sell to be satisfactory and to be of better QUALITY than you could obtain elsewhere for the same money. If not, send them back and I will refund your money, together with whatever transportation charges you paid.

L. C. BOLSON

(The Man That Delivers the Goods),

Route 4,

DECORAH, IOWA

some importance because nests that do not work properly cause inaccuracies in the records. The trapnest chosen ought to be one that will close easily when the hen goes inside and that will prevent any other hen from entering while the nest is occupied. There are several satisfactory types of nests which can be built by the average poultryman, and there are also some commercial nests that give good service. As a rule, the more simple the nest the more satisfactory it is likely to prove. In addition to being accurate the trapnest ought to be so constructed that the hen can be easily removed by the attendant and should provide plenty of ventilation so the hens will not suffer unduly in hot weather. In some types of trap-nests many hens are lost during the summer months by suffocation in the nest. One trap-nest should be provided for each four or five hens that are to be trapped.

The person tending the trap-nests needs to have a regular schedule so that the birds in the nests will not be unduly neglected and other birds be forced to lay on the floor because all nests are full. As a rule the trap-nests are visited at least four times daily, many persons making it a practice of running the nests at 9 o'clock, 11 o'clock, 1 o'clock and 3 o'clock, and then checking over again to see that no nests are occupied after feeding time.

The matter of satisfactory records for keeping track of the egg production is of considerable importance and deserves study on the part of those who are taking up trap-nesting. One of the most satisfactory methods of handling the trap-nest records is to provide monthly sheets on which the daily production of each bird can be noted. As a rule not more than fifty birds should be listed on any one sheet on account of the time consumed in hunting for individual numbers and the danger of placing the record in the wrong space where the sheets are too large. In general it is much safer to write in the number of the hen on the record sheet each time she lays rather than making a check mark because where the numbers are written in any errors can be caught by checking the different columns, while there is no chance to catch the errors when check marks are used. The methods of handling the monthly record sheets in the pen vary considerably with different operators. Probably the poorest method is to carry the sheet along and record each egg on the monthly sheet as it is gathered, as this almost invariably results in the sheet becoming very much soiled before the month is finished and is likely to result in many errors on account of handling the record sheet and the hens and eggs all at the same time.

Where there is no objection to marks on the eggs, simply marking the number and date on each egg at the time it is gathered and then checking off the eggs on the monthly record sheet at the end of the day, is a fairly satisfactory method. However, the marks on the eggs are likely to injure their market value, and for this reason some other method is usually employed. One very satisfactory plan is for the person who runs the trap-nests to carry a simple memorandum pad on which he notes down the number of each hen that lays and then these numbers are posted at the end of the day on the monthly record sheet. This can be simplified somewhat further if the memorandum pads have numbers for all the hens in the pen printed on the sheet so that the person running the trap-nests simply checks the numbers of the hen that lays.

Some system of keeping the record for each individual hen by months is also needed, and definite forms for this should be worked out by all those who undertake trap-nesting. The most elaborate system of follow-up for yearly records is to have a separate sheet for each hen on which her production for each month is listed. A somewhat simpler method is to have sheets large enough to hold the monthly records of a number of hens and then arrange the hens in numerical order on this sheet, and write in under each month the production for each individual hen.

Trap-nesting is not likely to prove profitable unless it is carried through so that an entire year's record is gotten on the best birds and then these records used as a basis of pedigree breeding; and those persons who cannot see their way clear to follow this program through to its logical conclusion probably will do well to decide that they will leave trap-nesting to the other fellow and buy their breeding stock from the man who does carry the program all the way through.

It is time that houses were cleaned, disinfected used, windows washed to admit sunshine, and the dust brushed off the muslin curtains. Patch leaks in the roof, and litter the floor with fresh straw.

EVEN THE UPPER AIR IS CHARTED

To guide the aviator, the air lanes have been mapped—in the field of High Average Egg Production, combining Standard Exhibition Ideals in S. C. White Leghorns the roads that lead to Genuine Quality are also marked.

The results our birds have given our customers is in reality a chart that all shrewd buyers should follow.

SWEEPSTAKES WINNERS

MISSOURI

Bethany, Mo., Sept. 13, 1921.

Mr. Wm. Shands,
Little Blue, Mo.

Friend Shands: Had intended advising you as to my winnings as I promised sooner, but have been so busy since the close of the fair have neglected it.

The pen won first young pen in their class; the cockerels won championship cockerel of the show and the pen won championship young pen of the show; besides this I won two A. P. A. specials and a special from the National S. C. White Leghorn Club. I claim that's not half bad.

These birds were the big attractions of the exhibit and have had many compliments on them since.

With best wishes, I am,

Yours very truly,

W. C. BROWN.

What Did Your Layers Earn For You Last Winter?

---What Will They Earn For You This Winter?

Whether your answer to these questions gives you reason to be mighty well satisfied, or decidedly disappointed, depends on how well you understand, and how carefully you follow, a few simple rules.

A Book That Tells You How It's Done

If you want the big profits that come from having lots of eggs to sell at winter prices, you'll want to read our new book, "More Eggs For Less Money."

This book tells, in plain, every-day language, how to increase the laying average of any flock. It shows exactly what is needed to make your hens produce more and better eggs when most hens are "on a laying strike."

Don't mistake this book for a mere "chicken feed advertisement." It doesn't try to tell you what feed you ought to buy. It shows you how to analyze all feeds and judge for yourself. Reading it will enable you to judge, with remarkable accuracy, the egg-making value of any feed or combination of feeds. If you want "More Eggs For Less Money" write for this free book. Ready for mailing October 10th.

The Basic Feeds Co., Dept. 325 1019 State Str. Lockport, Illinois

BUFF ORPINGTONS

Teasingly good offerings in mature birds or growing youngsters for any show or mating.

SPECIAL BREEDING CKLS. at \$5, \$10 and \$15 each. The BIG GOLDENS represent all that is good in Modern Orpingtons of full massive form, Standard station and detail refinement. Chicago Coliseum Quality at its best. Approval and C. O. D. shipments. Satisfaction always. This is why

Wyant Bros. of Thorntown, Indiana

handle a larger business than some using more space in the journals. They actually believe in laying out part of their advertising appropriations in SUPERIOR SHIPMENTS as well as in Journal space.

Others give good values, but one familiar with the fundamentals of sound business feels a comfortable sense of security in placing an order for the BIG GOLDENS.

A Program of Work That Will Bring Results

(Continued from page 915)

Those that have loafed all summer will be yellow. (f.) The late moulter is probably the better hen. (g.) The head parts are full, bright, indicating good circulation of blood, and vigorous vitality. Of course, as even the best hens get into the moult and begin their resting period the head parts will diminish in size somewhat, and this should not be counted against such hens.

Remember that in any breed hens must have some bottom, some substance before they can go through a heavy season of egg production. This practically means that for the breed the hen selected to keep should be of good size. Keep close to the requirements of the Standard of Perfection requirement as to size, and you will not go wrong.

It is a mighty convenient thing, when October appears, to find the hens marked with colored leg bands, the result of having culled, selected, and handled them two or three times during the past year. As a suggestion for another year, go over the pullet flock of layers in December, marking the fowls laying at that time with a white celluloid leg band, indicating early beginners. Go over flocks again in late April or May, again marking with leg bands those laying this time with a blue band. Probably most white bands will also receive a blue one. In late July or August at culling time mark the layers with a black band. Then when October comes the hens will be classified, and very readily sorted. The writer believes it is well to use this color scheme even when the fowls are trap-nested, as it helps so much in the fall when sorting time is here. If, in October, we see a hen with a blue and black band, we know that that hen was laying in the spring and laid well into the summer, but did not begin early. And thus may the bands we read quickly and readily.

Keeping Old Hens

Keep any yearling or two-year-old hen that is in vigorous health, and shows signs of having been an efficient producer. In all probability she will be used as a breeder. Her past production has shown that chicks from her will be of value. Even if she herself does not pay large dividends by the eggs she produces she will more than repay for her keeping by her contribution as a breeder. Do not breed from pullets. Breed from yearling and older hens, which are the result of selection.

Particularly because these hens are to be used largely as breeders, make it a point to select them carefully as to type and color. Breeding nearer to the standard, and keeping pure blood lines, will greatly increase the sale value of poultry products in future years. The buying public wants quality, uniformity, standard-bred stock. Aim to produce what will return the greatest interest on money invested in hens.

Epsom Salts As A Green Feed

This article should help the city back-lot poultryman work out the problem of green feed for the flock, also save some money and increase the egg yield.

I give my flock of Leghorns and Reds one ounce of epsom salts daily to every six hens, mixed in a small amount of moist mash fed at noon. We warm this mash on cold days, as they eat it with more relish. It absolutely takes the place of green food and keeps the flock in fine shape. It regulates their digestive organs and keeps them in laying condition.

The egg yield of my flock has increased since I began using salts. I attribute this to their eating more mash and grain, consuming about 20 per cent more grain and mash. This is about the amount of green food consumed on an average and naturally this extra amount goes into eggs.

I first want to know that I have a heavy laying strain of birds, then I endeavor to encourage them to eat as much of a good laying mash as I possibly can.

When my runs became bare of flora this late Summer I gave the growing stock one ounce of epsom salts in a wet mash to every ten chicks and I never had pullets mature earlier. Several of them were laying before five months of age.

Our State Experiment Station has been experimenting with epsom salts and has pronounced it a success. We are enthusiastic about it and trust that others will try it.

Ky,

E. B. McQUOWN.

Wilburtha Farms Removal Sale

White Plymouth Rocks Single Comb White Leghorns Jersey Black Giants

Wilburtha Farms, situated on the outskirts of Trenton, N. J., has been sold, due to the growth and encroachment of the city of Trenton, and we are moving our stock and plant to a new and better location, one mile away. For this reason we wish to sell about 2,000 birds during the next sixty days at reduced prices. This includes both young and old stock, closely related to our Garden Winners and to the birds that won such a remarkable victory at the New York State Fair last month. At this Fair our birds won Best Display in White Plymouth Rocks, White Leghorns and Black Giants, winning fifteen first prizes out of a possible eighteen, including every first prize on male birds.

Write us as to what you are in the market for, and we will be glad to price and describe such birds as will meet your requirements.

The "EVERGREEN" Oat Sprouter

—the sprouter that's different

Cuts Your Feed Costs

Satisfied Users Everywhere

The BEST is the CHEAPEST

At Last! The Perfect Oat Sprouter

After many years experimenting to produce an oat sprouter that would produce the greatest amount of tender green oat sprouts in the shortest time with less trouble and without any waste or spoilage, we have at last succeeded. This new improved EVERGREEN OAT SPROUTER is in a class by itself. Whether you are a "back-lotter" with only a few birds or if you are raising poultry on a large scale you need an EVERGREEN OAT SPROUTER—it spells SUCCESS to every poultry raiser—it cuts down feed costs—it

Converts One Bu. Oats Into More Than 3 Bu. Green Feed

The secret of the success of the EVERGREEN is in its two heat chambers—its interior arrangement—its heating system and its convenience. We discovered that different degrees of heat were necessary during varying stages of germination and growth of oat sprouts to get best results—the EVERGREEN supplies the different temperatures during the various stages—that's why it produces more green feed with less grain and spoilage. EVERGREEN machines supply you with a never ending supply of an abundance of tender green sprouts, enough for your flock of hens every day. Each day put in a tray of raw oats, at top of machine and take out tray of tender sprouts at bottom—it's a revelation.

FREE Catalog Write today for descriptive catalog folder and price list, telling all about this wonderful machine—how it will enable you to double and treble your poultry profits. Don't buy an oat sprouter of any description until you find out about the better, more convenient EVERGREEN.

Free Book Tells How

Putting the Birds in Show Condition

(Continued from page 918)

Before putting the bird into the fourth tub, which contains blueing water, be sure to stir the water thoroughly, rubbing the hand round the side and over the bottom of the tub to make sure that the blue is evenly distributed, as, if there is any left on the tub for the bird to rub against, it is very difficult to get it off the feathers. After giving the bird a thorough dip in the blue the surplus water is squeezed from the plumage and the bird either dried with towels or placed in a coop to drain. This drying coop is made with a wire bottom and across the center of the coop is placed a roost on which the bird is placed. When the plumage is about half dry go over it and saturate it with hydrogen peroxide; this will remove the oil and give lustre to the plumage.

After the bird is dry go over it and carefully remove all body feathers that show any trace of foreign color. Rub the shanks with a flannel cloth on which has been put a few drops of olive oil. Just before the judging wash the comb and wattles with cold water, using a brush for the purpose; this will bring the color to the face. This is the final touch to put the bird in the pink of condition.

The 1923 Standard will more clearly define fitting and faking. Legitimate fitting will include the pulling of occasional off-colored feathers in neck, back, breast, body and wing bows, as I have suggested above. No one knows how many feathers there are in these sections. Nature often makes a mistake in coloring up one or two of them. The experienced conditioner plucks them. The amateur should do the same, remembering that morals are established by custom, and in following the established custom he does no wrong. However, do not pluck main tail or main wing feathers; do not bend these feathers, or crimp back feathers, or substitute feathers by gluing them in. To do so is established as dishonorable and is termed faking. To the novice the distinctions may not be clear, but experience will teach him that the established differences between fitting and faking are founded on practical lines.

Small and Soft-Shelled Eggs

Some of the early pullets are now coming into lay and beginners will find that soft-shelled, very small, and double yolked eggs are very often produced. All these are the result of overfeeding and forcing foods. Soft-shelled eggs are said to be due to lack of grit and shell, but even where these are before the birds all day long, soft-shelled eggs will be found if the feeding is not right. A great mistake is made in giving highly bred laying stock too much animal food during the period of growth. Many put their young pullets on to a mash containing 10 per cent animal food when they are three to four months old. This is the real cause of soft-shelled and double yolked eggs, it also has important bearing on egg size for it results in a too early maturity and the egg organs begin the work of production before they are really fit to do so. The result, very often, is the small egg.

Many beginners find that although the pullets have grit and shell before them, soft eggs are often produced. It is the result of forced growth. Until the pullets are actually laying, 5 per cent of animal food is all they require. The object of the extra 5 per cent is to maintain production and bodily health. Five per cent animal food is all that is required for growth.—National Poultry Journal, England.

Australian Orpingtons

A club has been formed in England to promote Australorps, which are Australian Orpingtons of the Black variety. A. H. Maxey, Australia, has exported fifty pullets and five cockerels to the Australorp breeders in England, the birds are descendants of six females that had records of 295 to 326 eggs in 12 months. With the likelihood of big demands being made by English breeders on Australia for the utility type of Orpington that has evidently won fame for its laying powers, and to establish a definite understanding both of the true interpretation of the Orpington Standard and the necessary texture of feathering in-so-far as to how tight or how slack it shall be, the Orpington men of Australia are getting together.

LIGHT BRAHMAS COCKERELS PULLETS

NOW READY. Big, vigorous free range raised stock that will put size and vitality in your flock. Bred for heavy egg production. Standard requirements, mammoth size and vigor. Order now and get the pick of the flock. Utility, \$3.50 and \$5.00 each—exhibition birds, \$7.50 and \$10.00 each. Select mated pen of four pullets and cockerel, \$25.00. SATISFACTION GUARANTEED ON ALL SALES. FREE catalog.

More Practical, Economical, Safe

**Easy to Handle
Less Floor Space**

The SUCCESSFUL 300 Unit Hatcher

GIVES you big capacity in small space. This triple deck arrangement has a 900 egg capacity in only 12½ square feet of floor space. It produces better hatches. It is easier to operate.

Our 30 years manufacturing experience has taught us this. Letters from enthusiastic customers prove it. Actual tests comparing the Successful machine with the so-called mammoth incubator have shown that the SUCCESSFUL produces 10%, 20% to 30% better hatches. Its actual installing cost per egg unit is from 10c to 14c compared with 17c to 30c for the big capacity incubators.

No Expert Operators Needed

Add hatching units as you need them. Install them yourself in 20 minutes. You need no factory assistance. You need no expert operators. Operate each unit independently of any other in the series if you wish. Any child can turn the eggs in 30 seconds or adjust the tray for cooling. Heat with gas or use the SUCCESSFUL lamp shown in the picture. Small expense either way—no night watchmen needed. Is it any wonder one customer writes: "Among the seven different makes of incubators I used last year the Successful machines proved to give the best results."

Our 30 Years Experience

is at your service. Tell us about your plans, how much equipment and floor space you have. Ask for free booklet on the "Successful"—it's full of information and contains letters from enthusiastic owners of SUCCESSFUL 300 Unit Hatchers.

It's no secret—Parks' ^{Bred-to-Lay} Barred Plymouth Rocks Not only lay but transmit it permanently to their off-spring

That accounts for our wonderful demand for COCKERELS. In fact such a demand that of late years we seldom have many left by the first of the year.

Right Now We've a Grand Selection of COCKERELS and you can buy them at PULLET PRICES. By buying early, you get best selections, save money, and birds get thoroughly acquainted, and acclimated before cold weather sets in, and by the way you can look for poor rail service when cold weather sets in and roads get jammed with coal.

Just remember its Parks' strain that made and hold about all the World's Barred Rock Laying Records in addition to being well up in Standard Quality.

*"Shipped
200,000
chicks
in
1921"*

Another Buckeye Record of successful growth from a modest start

A. C. Sieb of Lincoln, Illinois, has been in the hatchery business eight years. Not until four years ago, however, did he install his first Buckeye Incubators—two No. 6 Buckeye Mammoths.

The results of this conservative beginning impelled him, in February, 1921, to clean house, sell all his old machines and install four No. 7 Buckeye Mammoths of 10,368 egg capacity each. And in this short season he shipped 200,000 chicks. *He has nearly 10,000 customers throughout the United States, shipping even to Oregon and Washington, and to British Columbia, owing to the strength and vitality of Buckeye-hatched chicks.*

He tells us: "There is no machine that will equal the Buckeye. It is a time saver, labor saver, extremely economical and easy to operate."

There is no more certain source of profit in business today than the commercial hatchery equipped with Buckeye Mammoth Incubators. More than eight hundred successful hatcheries are proving it—and not a single failure.

The Buckeye removes the uncertainty,

the guesswork, the gamble, by delivering the highest percentage of strong, healthy chicks. *You know* to within one to five per cent just what your hatch will be. We will be glad to send our Buckeye Mammoth Catalog which tells all about this remarkable invention. Let us show you how to start small and grow big in the commercial hatchery business.

What Constitutes an Ideal Market Fowl

(Continued from page 917)

turtles than fowls. Fad breeding for thighs and shanks wide apart has led to ignoring depth of body, and in some instances the depth between back and breastbone are but two-thirds of the Standard depth. With thighs and shanks as wide apart in measurement as the depth of the carcass you get a turtle shape which we see so much of today to the detriment of the breed.

This has also produced a hardness of flesh as well as a hardness of feather not compatible with the standard of an ideal market fowl in America. True, the Cornish fowl if properly roasted or cooked, is an incomparable table fowl in both quality and quantity. But America is not England, and American cooks want a roaster that will roast in "quick-fire" style, from one to one and one-half hours. A Cornish roaster needs two and one-half hours in a slow oven to cook it to the "biteable" stage of the "ideal market fowl." The flesh of an ideal market fowl for our American markets must not be hard or of too tight or close fiber. In short, it must be of a fiber that will be tender at almost any age.

The old English poultry writer and authority, Harrison Weir, understood the differences years ago and even then realized the fad-tendencies of the Dark Cornish breeders toward too hard flesh fiber. He advised in his famous book on poultry that to get the ideal market fowl one must cross the Cornish on the Dorking, the latter breed having a fine grained, tender skin and comparatively light bones. Prof. Graham of the Ontario Agricultural College, Canada, in more modern experiments has found the cross of Cornish on Orpington to produce the tender flesh quality of the ideal market fowl.

Influence of Feathering

This same idea and belief influenced me 25 years ago to introduce Brahma blood in my breed to loosen the tight fiber of the Dark Cornish, as the Brahma fiber is the opposite of the Cornish in this respect. It was this idea that controlled the operations of the originators of that Canadian breed, Chanteclers.

Then, again, too tight feathering does not assist the ideal market fowl in its growth as broilers. The plumage must be abundant enough, and must grow early enough and quickly enough to keep the growing chick warm at the critical stages of its growth. This has been proven in growing quick broilers where White Leghorns were crossed with Cornish. These cross-bred chicks outgrew the Cornish in abundant, tender flesh, almost doubling the size of pure-bred Cornish in the first ten weeks because the plumage tendency of the Leghorn resulted in more abundant and adequate protective covering for their bodies while growing.

The history of the French breeds shows an origin from crosses that were made to produce ideal flesh properties. The history of the English breeds, other than the Dark Cornish, also show original crosses to make the tender flesh quality of the ideal market fowl.

The development of the Jersey Black Giants, and their origin from the wide fiber of the Brahma, the medium fiber of the Langshan and the closer fiber of the Java, show the value of such combinations in producing an ideal market fowl, or as near ideal as nature will permit.

The tremendous popularity of the Orpington family can be attributed, in a great measure, to the quality of flesh fiber. The Speckled Sussex is recognized in England as the peer of all meat breeds for this quality alone. But, flesh quantity and quality is not the whole thing. They are simply necessary factors to a complete whole. There are other factors. Market appearance is as important as either. Color of skin has an influence, but that influence is not as strong as formerly. Color of legs may be classed with skin color, yet in some respects is an independent factor swayed by prejudice similar to skin color. A factor, powerful in its influence, yet one hardly ever considered important by Standard makers, is the undercolor. It has a tremendous influence on the popular favor, the success of any variety. A study of breeds reveals the influence of this factor, for or against it.

The original Wyandotte was the silver laced variety. The Standard undercolor is slate and some judges interpret this to mean dark slate. It is not an extra popular breed. The Silver Pencilled Wyandotte came into popularity in a single bound. But its first Standard called for dark slate undercolor and its popularity subsided as quickly as it had

DEAR MR. QUISENBERRY:

I did over a \$2,000.00 egg business last year. I surely have been successful with poultry since becoming a student of your school. Three years ago I knew absolutely nothing about culling, feeding for egg production, fertile eggs or housing. Now I am confident I am capable of handling a flock of any size I care to and do it successfully.

White Leghorns are no longer a side line with us. They are one of the main issues, as we realize more clear profit from our Leghorns than from any one grain crop, or the live stock, raised on our 400-acre farm.

Yours very truly,
MRS. H. A. HUME.

I WANT TO SEND every poultry raiser my new, free, 96 page book of money-making poultry secrets. Over 46,000 people say that I have shown them the sure way to make money. Do you know that half your flock is eating up your profits? Do you know how to tell good layers? Do you know how to make every hen pay a good dividend? My free book tells how. Simply send name for your copy TODAY!

**96 Pages of Money-Making Information;
Make Every Hen Pay Big!**

This book outlines easy methods that show you how to be sure of big egg production, regardless of weather conditions. It gives the secrets that have given Prof. Quisenberry his world-wide reputation. Prof. Quisenberry is the founder of the Missouri State Poultry Experiment Station; Manager American Egg Laying Contest; Assistant Chief Panama Pacific Exhibition; Secretary Heart of America Poultry Show; author and lecturer. A few of the subjects outlined are shown here. There are many others equally valuable.

This Book Tells

- How to Get More Eggs and Save Feed,
- How to Get Big Egg Yields in Cold Weather,
- How to Cull Money-Losing Hens,
- How to Tell Drones, Loafers and Poor Layers,
- How to Tell Good Layers Without Using Trap Nests,
- How to Mix and Balance Feed Ration to Get Egg Yield,
- How to Select Males or Females That Produce Hatchable Eggs and Strong Chicks,
- How to Prevent Colds, Roup, Etc,
- How to Avoid White Diarrhea and Bowel Trouble,
- How to Feed Chicks From Start To Finish,

Let me place this FREE BOOK in your hands—without obligating you in any way.
